Computer Networks and Data Communication

Laboratory Manual

CSCSL-3205

Semester 6th
Spring-2022

Student's Name: Muhammad Ahsan

Roll Number: 1912310

Lab Instructor: **Engr. Mubeen Ahmed Khan**

Department of Computing Sciences
Shaheed Zulfiqar Ali Bhutto Institute Of Science And Technology, Karachi,Pakistan
Tel:(021)111-922-478, Fax: (021)35830446, Email: info@szabist.edu.pk

Introduction

This laboratory course operates in co-ordination with the companion lecture course, CSC 2202, Data Communications and Computer Networks. This laboratory course presents 15 laboratory experiments on Computer Networks world. They provide hands on experience to the students on Interconnecting the Cisco Networks and Devices. Also over routing and switching essentials and techniques.

LAB OBJECTIVES

Upon successful completion of this Lab course, the student should be able to:

- ➤ Understand and explain Data Communications System and its components.

- ➤ Build an understanding of the fundamental concepts of computer networking.

- ➤ Identify the different types of network devices and their functions within a network

- ➤ Familiarize the student with the basic taxonomy and terminology of the computer networking area.

- ➤ Familiarity with the basic protocols of computer networks, and how they can be used to assist in network design and implementation.

- ➤ Independently understand basic computer network technology.

- ➤ Identify the different types of network topologies and protocols.

- ➤ Enumerate the layers of the OSI model and TCP/IP. Explain the function(s) of each layer.

- ➤ Understand and building the skills of subnetting and routing mechanisms.

- ➤ Introduce the student to advanced networking concepts, preparing the student for entry Advanced courses in computer networking.

- ➤ Allow the student to gain expertise in some specific areas of networking such as the design and maintenance of individual networks.

LIST OF EXPERIMENTS

S#	Date	Experiments	Page
1	3/20/2022	Introduction to computer networks. Also introduce WINDOWS network diagnostics commands in command line.	7
2	3/20/2022	Introduction to Cisco Packet Tracer, Introduction to cisco IOS, Establishing a console session and basic router and switch configuration.	15
3	3/27/2022	Identifying IPv4 Addresses. Configuring on Network Devices. Configuring Static IP Addresses to Navigate the two different networks. Configuring and Verifying VTY Restrictions.	32
4	4/1/2022	Configuring Basic DHCPv4 on a Router, Configuring Basic DHCPv4 on a Switch, Troubleshooting DHCPv4.	52
5	4/25/2022	Configuring VLANs, Trunking and VTP, Troubleshooting VLAN Configurations, Implementing VLAN Security, VLAN Plan Instructions.	71
6	5/1/2022	Configure Security Features on Switch (port Security), Configuring Per-Interface Inter-VLAN Routing, Configuring 802.1Q Trunk-Based Inter-VLAN Routing (Router on a Stick), and Troubleshooting Inter-VLAN Routing.	102
7	5/15/2022	Configuring IPv4 Static and Default Routes, Designing and Implementing IPv4 Addressing with VLSM, Calculating Summary Routes with IPv4.	130
8	5/23/2022	Configuring Basic RIP and RIPng.	150
9	5/23/2022	Configuring Basic Single-Area OSPF.	158
10	5/23/2022	Configuring Basic EIGRP.	163

SUBJECT: CSCL-2202 Lab: Data Communication and Computer Networks (BCS/BS)

Marks Evaluation Sheet

Sr. No.	Topics	Marks/Grade	Date Performed	Date Checked	Examiner Initial's
1	Introduction and network trouble shooting tools.				
2	Introduction to Cisco IOS. establishing console session Basic router configuration				
3	establishing remote session with cisco IOS Basic switch configuration				
4	Static IP Addressing				
5	DHCPv4				
6	VLANs, Trunking and VTP				
7	Security Features on switch (Switch Port Security)				
8	Inter VLAN routing (router on a Stick)				
9	static, default routes and VLSM				
10	RIP				
11	OSPF				
12	EIGRP				
13	ACL (Standard)				
14	NAT				

<u>Guidelines to Students</u>

- ➢ Students must thoroughly read the assigned work. It will be assumed that they have studied the assigned work and have understood the majority of the material and technical terms before the start of the experiments.

- ➢ For safety reasons, students are requested not to leave their equipment unattended during the laboratory session. In the case of special circumstances, please seek the support of the class teachers/demonstrators.

- ➢ All practical contribute to the final results of the sessional course. Thus any absent laboratory session automatically means lost marks for the final grade. Under special circumstances (supported by documentary proof), e.g. illness and other reasonable causes a laboratory session may be re-scheduled upon approval of the head of the department.

- ➢ During the class, students will be continuously assessed by performance test on each and every experiment.

- ➢ To ensure your fellow students can proceed with their experiments in a degree of comfort and without undue noise and other disturbances, keep the noise level down and stay in your own laboratory bench area. Mobile phones should be switched off during the experiments.

- ➢ Equipment in the laboratory for the use of student community. Students need to maintain a proper decorum in the electronics and computer laboratories. Student must use the equipment with care. In case of any damage, students should be pay for it.

- ➢ Students are required to carry their report sheet, observation books or laboratory exercise manuals with complete exercises while entering the laboratory.

- ➢ CD burns with all Simulink task files and attach at the end of this manual.

- ➢ Laboratory records needs to be submitted on or before date of submission.

Experiment#01

Introduction to Computer Networks and Windows Network Troubleshooting Tools

Part #1: Objectives:

- Introduction to Computer networks.
- Describe the functions and physical characteristics of the network device.
- Describe the functions and physical characteristics of the media.

Background / Scenario:

A computer network is a group of computer systems and other devices that are linked together through communication channels or media to facilitate communication and resource-sharing among a wide range of users.

Components of a computer network:

There are three categories of network components:

1. Devices
   - End devices (computer, printer, security cameras, etc.)
   - Intermediary devices (router, switch, hub, firewalls)
2. Media
   - Wired
     - Cooper (UTP, STP)
     - Fiber optic (multimode fiber , single mode fiber)
   - Wireless
3. Services

As a member of the networking support staff, you must be able to identify different networking equipment. You must also understand the function of equipment in the appropriate part of the network. In this lab, you will have access to network devices and media. You will identify the type and characteristics of the network equipment and media.

Identify Network Devices

Fill in the table below with the device tag ID number, manufacturer, device model, type (hub, switch, and router), functionality (wireless, router, switch, or combination), and other physical characteristics, such as number of interface types. The first line is filled out as a reference.

ID	Manufacturer	Model	Type	Functionality	Physical Characteristics
1	Cisco	1941	Router	Router	2 GigabitEthernet Ports 2 EHWIC slots 2 CompactFlash slots 1 ISM slot 2 Console ports: USB, RJ-45
2	Cisco	Catalyst 2690 Plus	Switch	Switch	2 Gigabit Ethernet 2 SFP ports 24 Ethernet ports
3	Cisco	Catalyst 2690	Switch	Switch	2 Gigabit Ethernet 24 Ethernet
4	Cisco	1841	Router	Router	1 console port, 1 AUX, 2 Fast-Ethernet, 2 serial port
5	Cisco	2911	Router	Router	2 serial ports, 1 AUX , 2 Fast-Ethernet, 1 Console port
6					

Identify Network Media:

You will name the network media, identify the media type (copper, fiber optic, or wireless), and provide a short media description including what device types it connects. Use the table below to record your findings. The first line in the table has been filled out as a reference.

ID	Network Media	Type	Description and to What It Connects
1	UTP	Copper	Connect wired NIC and Ethernet ports on network devices Cat 5 straight-through wired. Connects PCs and routers to switches and wiring panels.
2	UTP Straight through	Copper	Connect wired NIC and Ethernet ports on network devices Cat 5 straight-through wired. Connects PCs and routers to switches and wiring panels
3	UTP cross over	Copper	Connect like devices on a network, CAT 5 cross over, connects switches to switches, etc.
4	Serial Console	Copper	Connects devices to a switch or router to program them
5			
6			

Reflection

After you have identified the network equipment, where would you find more information about the equipment?

Basically there are a lot of resources to find more information about these, the first one would be the user-manual that is given along with the equipment and for further more or if we don't have any manual then we would research it on the internet.

Part#2: Objective:

● Windows Network Troubleshooting Tools

Back Ground Scenario:

If you call technical support about problems with your network or Internet connection, they will most likely have you use some or all of these utilities. You should check all of the hardware connections as well. Refer to the Network Connections handout for a detailed description of networking connections.

Some Useful Connectivity Utilities :

➢ **ipconfig – (IP configuration)**

Use ipconfig to find the IP address and configuration of your own computer and network. By default, ipconfig only displays the IP address, subnet mask, and default gateway. For more in depth information, add the text /all after ipconfig. You will be able to view all of the IP configuration information for the computer.

➢ **ping – (p**acket **i**nter**n**et **g**roper**)**

A utility to determine whether a specific IP address is accessible. It works by sending a packet of data to the specified address and waiting for a reply.
If you are having difficulty accessing the Internet, try using the ping command to connect to the different network nodes to narrow down where the problem could be coming from. For instance, if you are able to ping the network card, but not the router, the problem is most likely local. If you can ping everywhere except for a certain outside address, the problem is remote.

Syntax: **ping *IP address or domain***

➢ **tracert – (trace r**oute**)**

A utility that traces a packet from your computer to an Internet host, showing how many hops the packet requires to reach the host and how long each hop takes. If you're visiting a Web site and pages are appearing slowly, you can use trace route to figure out where the longest delays are occurring.

Syntax: **tracert *IP address or domain***

➢ **nslookup – (n**ame server **lookup)**
Nslookup is the name of a program that lets an Internet server administrator or user enter a host name (for example, www.yahoo.com) and find out the corresponding Internet address. It will also do reverse name lookup and find the host name for an IP address you specify.
Nslookup sends a domain name query packet to a designated (or defaulted) Domain Name System (DNS) server. Depending on the system you are using, the default may be the local DNS name server at your service provider, some intermediate name server, or the root name server (at InterNIC) for the entire domain name system hierarchy.

Syntax: **nslookup *IP address or domain***

Using Ipconfig:

1. Log on to the computer as a user with administrative rights.

2. Click **Start** and select **Run** (Windows Vista or Windows 7   Click the "Start" button and type in the "Search for Programs and Files" text box).

3. Type **cmd** and press ENTER. The black Command Prompt window will appear.

4. Type **ipconfig** at the command prompt and press ENTER. The following screenshot gives an example of the information shown when using "ipconfig".

5. Write down any configuration information you will need. At a minimum, it will be the IP address of your computer and the Default Gateway.

6. Sometimes you might need more information and you can add the "/all" to the above "ipconfig" command. This screenshot gives an example of the information shown when using "ipconfig /all":

Using Ping:

1. Log on to the computer as a user with administrative rights.
2.   Click **Start** and select **Run** (Windows Vista or Windows 7   Click the "Start" button and type in the "Search for Programs and Files" text box).
3. Type **cmd** and press ENTER. The black Command Prompt window will appear.
4.   Type **ping *IP address or domain*** and press ENTER. If you are unable to ping a destination, first check to see that there are no typing errors. If the address is correct, use the Troubleshooting Routing Errors table below to examine what the cause could be.

cA successful ping looks similar to this:

```
C:\>ping 4.2.2.2

Pinging 4.2.2.2 with 32 bytes of data:

Reply from 4.2.2.2: bytes=32 time=80ms TTL=243
Reply from 4.2.2.2: bytes=32 time=70ms TTL=243
Reply from 4.2.2.2: bytes=32 time=70ms TTL=243
Reply from 4.2.2.2: bytes=32 time=70ms TTL=243
```

Use any or all of the following address options to determine where the connection is failing.
• **ping the Ethernet card (NIC) in your computer** — this will always be 127.0.0.1
• **ping your own computer** —use ipconfig to look up the IP address, if necessary.
•   **ping the Default Gateway (router)** — you can find the Default Gateway on the computer in the same spot as the IP address.
• **ping an outside IP address** — for example the Level3 DNS Server 4.2.2.2.
• **ping a domain name to check DNS** — for example: ping www.google.com.

Troubleshooting Ping Errors

Once all of the hardware connections are checked and verified, any of the following could be the cause of your networking error(s).

Symptom	Possible Causes
Unable to ping the NIC.	The NIC is disabled or faulty.
Unable to ping your own computer.	The IP address is incorrect.
Unable to ping the Default Gateway.	The computer is disconnected from the network. The Default Gateway is down. The gateway address used in ping is incorrect. The gateway is not attached to the subnet.
Unable to ping an outside IP address.	The outside server is offline. The IP address was typed incorrectly. A packet is routed incorrectly between the source and destination networks.
Unable to ping a domain name.	The DNS server is not working. The destination server is offline.
Internet connections are slow and or intermittent.	Internet traffic is heavy. There are problems with the line. Contact the phone or cable company.

Using Tracert:

1. Log on to the computer as a user with administrative rights.
2. Click **Start** and select **Run** (Windows Vista or Windows 7 Click the "Start" button and type in the "Search for Programs and Files" text box).
3. Type **cmd** and press ENTER. The black Command Prompt window will appear.
4. Type **tracert** *IP address or domain* and press

ENTER. The following screenshot shows an example using

nslookup.

```
C:\>tracert 64.64.120.40

Tracing route to web01chi-pub.tgnt.net [64.64.120.40]
over a maximum of 30 hops:

  1    <10 ms   <10 ms   <10 ms  6509-brouter [172.16.40.2]
  2    <10 ms   <10 ms   <10 ms  bmgfinetrouter [64.64.60.2]
  3     10 ms    10 ms   <10 ms  teligentbgp [192.168.254.5]
  4     *        <10 ms   <10 ms  192.168.254.13
  5    <10 ms   <10 ms   <10 ms  216.251.12.129
  6     40 ms    50 ms    40 ms  atm1-916.chirtr001n0.tgnt.net [216.251.13.145]
  7     50 ms    50 ms    40 ms  web01chi-pub.tgnt.net [64.64.120.40]

Trace complete.
```

Tracert returns results in milliseconds (ms). Ideally, every hop should give an IP address and time. After requesting information from the DNS server, the first hop is to the default gateway. The hop to the default gateway should take 10-20 ms. After that, hops should take anywhere from 80-120ms. Errors indicated by ***** on the route can show where there is a lot of network traffic or possible line problems

Using Nslookup:

1. Log on to the computer as a user with administrative rights.
2. Click **Start** and select **Run** (Windows Vista or Windows 7 Click the "Start" button and type in the "Search for Programs and Files" text box).
3. Type **cmd** and press ENTER. The black Command Prompt window will appear.
4. Type **nslookup** *IP address or domain* and press ENTER.

The following screenshot shows two examples using nslookup. The first looks up an IP address (4.2.2.2) while the second looks up a domain name (www.yahoo.com).

```
C:\Users\steve>nslookup 4.2.2.2
Server:  falcon.heyshields.local
Address:  10.1.1.20

Name:    b.resolvers.level3.net
Address:  4.2.2.2

C:\Users\steve>nslookup www.google.com
Server:  falcon.heyshields.local
Address:  10.1.1.20

Non-authoritative answer:
Name:    www.google.com
Addresses:  2607:f8b0:400a:802::1010
          173.194.33.112
          173.194.33.115
          173.194.33.114
          173.194.33.116
          173.194.33.113
```

• **Server:** the local DNS server used to look up the information.
• **Address:** the IP address of the local DNS server.
• **Name:** The domain name of the server hosting the remote domain or IP.
• **Address(s)**: The IP address(s) of the remote server.
• **Aliases:** The common name(s) used to identify multiple IP addresses or domain names.

<u>2.1:-</u> Packet Tracer - Navigating the IOS

Topology

S1

PC1

Objectives

Part 1: Basic Connections, Accessing the CLI and Exploring Help

Part 2: Exploring EXEC Modes

Part 3: Setting the Clock

Background

In this activity, you will practice skills necessary for navigating the Cisco IOS, including different user access modes, various configuration modes, and common commands you use on a regular basis. You also practice accessing the context-sensitive Help by configuring the **clock** command.

Part 1:   Basic Connections, Accessing the CLI and Exploring Help

In Part 1 of this activity, you connect a PC to a switch using a console connection and explore various command modes and Help features.

Step 1:   Connect PC1 to S1 using a console cable.

a.   Click the **Connections** icon (the one that looks like a lightning bolt) in the lower left corner of the Packet Tracer window.

b.   Select the light blue Console cable by clicking it. The mouse pointer will change to what appears to be a connector with a cable dangling off of it.

c.   Click **PC1**; a window displays an option for an RS-232 connection.

d.   Drag the other end of the console connection to the S1 switch and click the switch to bring up the connection list.

e.   Select the Console port to complete the connection.

Step 2:   Establish a terminal session with S1.

a.   Click **PC1** and then select the **Desktop** tab.

b.   Click the **Terminal** application icon; verify that the Port Configuration default settings are correct.

What is the setting for bits per second? 9600____

c.   Click **OK**.

d.   The screen that appears may have several messages displayed. Somewhere on the display there should be a Press RETURN to get started! message. Press **ENTER**.

What is the prompt displayed on the screen? hostname of switch and a > with a blinking underscore (switch>_) (User Exec) Meaning User mode

Step 3:   Explore the IOS Help.

a.   The IOS can provide help for commands depending on the level being accessed. The prompt currently being displayed is called **User EXEC** and the device is waiting for a command. The most basic form of help is to type a question mark (?) at the prompt to display a list of commands.

S1> **?**

Which command begins with the letter 'C'? connect

b.   At the prompt, type **t**, followed by a question mark (**?**).

S1> **t?**

Which commands are displayed? telnet , terminal , traceroute

c.   At the prompt, type **te**, followed by a question mark (**?**).

S1> **te?**

Which commands are displayed? telnet , terminal

This type of help is known as **context-sensitive** Help, providing more information as the commands are expanded.

Part 2:   Exploring EXEC Modes

In Part 2 of this activity, you switch to privileged EXEC mode and issue additional commands.

Step 1:   Enter privileged EXEC mode.

a.   At the prompt, type the question mark

(**?**). S1> **?**

What information is displayed that describes the **enable** command? Turn on privileged mode

b.   Type **en** and press the **Tab** key.

S1> **en<Tab>**

What displays after pressing the **Tab** key? enable

This is called command completion or tab completion. When part of a command is typed, the **Tab** key can be used to complete the partial command. If the characters typed are enough to make the command unique, as in the case with the **enable** command, the remaining portion is displayed.

What would happen if you were to type **te<Tab>** at the prompt?

 Well nothing would happen because there are two commands starting from te one is telnet and one is terminal the prompt would be confused which one to display so it does not display anything however if you type more letters it would print the desired one such tel for telnet.

c.   Enter the **enable** command and press **ENTER**. How does the prompt change? Prompt changes to the privileged more instead of > there is now a # meaning privileged mode

d.   When prompted, type the question mark (**?**).

S1# **?**

Previously there was one command that started with the letter 'C' in user EXEC mode. How many commands are displayed now that privileged EXEC mode is active? (**Hint**: you could type c? to list just the commands beginning with 'C'.)

There are 5 commands now with c in beginning clear , clock , configure , connect , copy

Step 2:   Enter Global Configuration mode.

    a.   One of the commands starting with the letter 'C' is **configure** when in Privileged EXEC mode. Type either the full command or enough of the command to make it unique along with the <**Tab**> key to issue the command and press <**ENTER**>.

       S1# **configure**

       What is the message that is displayed?

       <u>Configuring from terminal, memory, or network [terminal]?</u>

    b.   Press the <**ENTER**> key to accept the default parameter enclosed in brackets **[terminal]**.

       How does the prompt change? <u>Switch(config)# //Now here we just have a bracket representing global config mode</u>

    c.   This is called global configuration mode. This mode will be explored further in upcoming activities and labs. For now exit back to Privileged EXEC mode by typing **end**, **exit** or **Ctrl-Z**.

       S1(config)# **exit**
       S1#

Part 3:   Setting the Clock

Step 1:   Use the clock command.

    a.   Use the **clock** command to further explore Help and command syntax. Type **show clock** at the privileged EXEC prompt.

       S1# **show clock**

       What information is displayed? What is the year that is displayed?

       <u>It displayed time with UTC, Day in 3 letters, Date. The year displayed is 1993</u>

    b.   Use the context-sensitive Help and the **clock** command to set the time on the switch to the current time. Enter the command **clock** and press **ENTER**.

       S1# **clock<ENTER>**

       What information is displayed? <u>Incomplete command</u>

    c.   The % Incomplete command message is returned by the IOS indicating that the **clock** command needs further parameters. Any time more information is needed help can be provided by typing a space after the command and the question mark (?).

       S1# **clock ?**

       What information is displayed? <u>set Set the time and date (Available command and it's purpose)</u>

    d.   Set the clock using the **clock set** command. Continue proceeding through the command one step at a time. S1# **clock set ?**

       What information is being requested? <u>hh:mm:ss Current Time</u>

       What would have been displayed if only the **clock set** command had been entered and no request for help was made by using the question mark? <u>Incomplete Command</u>

e. Based on the information requested by issuing the **clock set ?** command, enter a time of 3:00 p.m. by using the 24-hour format of 15:00:00. Check to see if further parameters are needed.

S1# **clock set 15:00:00 ?**

The output returns the request for more information:

<1-31> Day of the month

MONTH Month of the year

f. Attempt to set the date to 01/31/2035 using the format requested. It may be necessary to request additional help using the context-sensitive Help to complete the process. When finished, issue the **show clock** command to display the clock setting. The resulting command output should display as:

S1# **show clock**

*15:0:4.869 UTC Tue Jan 31 2035

g. If you were not successful, try the following command to obtain the output

above: S1# **clock set 15:00:00 31 Jan 2035**

Step 2: Explore additional command messages.

a. The IOS provides various outputs for incorrect or incomplete commands as experienced in earlier sections. Continue to use the **clock** command to explore additional messages that may be encountered as you learn to use the IOS.

b. Issue the following command and record the

messages: S1# **cl**

What information was returned? <u>Ambiguous command "cl"</u>
S1# **clock**

What information was returned? <u>Incomplete command</u>

S1# **clock set 25:00:00**

What information was returned?
<u>Invalid Input detected</u>

S1# **clock set 15:00:00 32**

What information was returned?
<u>Invalid Input detected</u>

Lab# 2.2:- Configuring Initial Switch Settings

Topology

Objectives

> **Part 1: Verify the Default Switch Configuration**
>
> **Part 2: Configure a Basic Switch Configuration**
>
> **Part 3: Configure a MOTD Banner**
>
> **Part 4: Save Configuration Files to**
>
> **NVRAM Part 5: Configure S2**

Background

> In this activity, you will perform basic switch configurations. You will secure access to the command-line interface (CLI) and console ports using encrypted and plain text passwords. You will also learn how to configure messages for users logging into the switch. These banners are also used to warn unauthorized users that access is prohibited.

Part 4: Verify the Default Switch Configuration

Step 1: Enter privileged mode.

> You can access all switch commands from privileged mode. However, because many of the privileged commands configure operating parameters, privileged access should be password-protected to prevent unauthorized use.
>
> The privileged EXEC command set includes those commands contained in user EXEC mode, as well as the **configure** command through which access to the remaining command modes are gained.
>
> a. Click **S1** and then the **CLI** tab. Press **<Enter>**.
>
> b. Enter privileged EXEC mode by entering the **enable**
>
> command: Switch> **enable**
>
> Switch#
>
> Notice that the prompt changed in the configuration to reflect privileged EXEC mode.

Step 2: Examine the current switch configuration.

> a. Enter the **show running-config**
>
> command. Switch# **show running-config**

b. Answer the following questions:

How many FastEthernet interfaces does the switch have? _24_____

How many Gigabit Ethernet interfaces does the switch have? _2_____

What is the range of values shown for the vty lines? _0 - 4 and 5 - 15__

Which command will display the current contents of non-volatile random-access memory (NVRAM)?

show startup-config

Why does the switch respond with startup-config is not present?

Because we have not saved any startup-config in our switch's NVRAM, that is why it's responding with that message and also there would be no startup-config present in the NVRAM of switch

Part 5: Create a Basic Switch Configuration

Step 1: Assign a name to a switch.

To configure parameters on a switch, you may be required to move between various configuration modes. Notice how the prompt changes as you navigate through the switch.

```
Switch# configure terminal
Switch(config)# hostname S1
S1(config)# exit
S1#
```

Step 2: Secure access to the console line.

To secure access to the console line, access config-line mode and set the console password to **letmein**.

```
S1# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
S1(config)# line console 0
S1(config-line)# password letmein
S1(config-line)#
login
S1(config-line)# exit
S1(config)# exit
%SYS-5-CONFIG_I: Configured from console by console
S1#
```

Why is the **login** command required?

So that we can set the password we configured to be required at login

Step 3: Verify that console access is secured.

Exit privileged mode to verify that the console port password is in effect.

```
S1# exit
Switch con0 is now available
Press RETURN to get started.
User Access Verification
Password:
S1>
```

Note: If the switch did not prompt you for a password, then you did not configure the **login** parameter in Step 2.

Step 4:   Secure privileged mode access.

Set the **enable** password to **c1$c0**. This password protects access to privileged mode.

Note: The **0** in **c1$c0** is a zero, not a capital O. This password will not grade as correct until after you encrypt it in Step 8.

> S1> **enable**
> S1# **configure terminal**
> S1(config)# **enable password**
> **c1$c0** S1(config)# **exit**
> %SYS-5-CONFIG_I: Configured from console by console
> S1#

Step 5:   Verify that privileged mode access is secure.

a. Enter the **exit** command again to log out of the switch.
b. Press **<Enter>** and you will now be asked for a
   password: User Access Verification

   Password:

c. The first password is the console password you configured for **line con 0**. Enter this password to return to user EXEC mode.

d. Enter the command to access privileged mode.

e. Enter the second password you configured to protect privileged EXEC mode.

f. Verify your configurations by examining the contents of the running-configuration file:

> S1# **show running-config**

Notice how the console and enable passwords are both in plain text. This could pose a security risk if someone is looking over your shoulder.

Step 6:   Configure an encrypted password to secure access to privileged mode.

The **enable password** should be replaced with the newer encrypted secret password using the **enable secret** command. Set the enable secret password to **itsasecret**.

> S1# **config t**
> S1(config)# **enable secret itsasecret**
> S1(config)# **exit**
> S1#

Note: The **enable secret** password overrides the **enable** password. If both are configured on the switch, you must enter the **enable secret** password to enter privileged EXEC mode.

Step 7:   Verify that the enable secret password is added to the configuration file.

a. Enter the **show running-config** command again to verify the new **enable secret** password is configured.

   Note: You can abbreviate **show running-config** as
   S1# **show run**

b. What is displayed for the **enable secret** password? _Some random encrypted letters_

c. Why is the **enable secret** password displayed differently from what we configured?
   Because secret is encrypted and not plain so that it can be protected from unauthorized viewer access

Step 8:   Encrypt the enable and console passwords.

As you noticed in Step 7, the **enable secret** password was encrypted, but the **enable** and **console** passwords were still in plain text. We will now encrypt these plain text passwords using the **service password-encryption** command.

S1# **config t**

S1(config)# **service password-encryption**

S1(config)# **exit**

If you configure any more passwords on the switch, will they be displayed in the configuration file as plain text or in encrypted form? Explain why?

<u>They will all be encrypted because we have already set the service for password encryption</u>

Part 6:   Configure a MOTD Banner

Step 1:   Configure a message of the day (MOTD) banner.

The Cisco IOS command set includes a feature that allows you to configure messages that anyone logging onto the switch sees. These messages are called message of the day, or MOTD banners. Enclose the banner text in quotations or use a delimiter different from any character appearing in the MOTD string.

S1# **config t**

S1(config)# **banner motd "This is a secure system. Authorized Access Only!"**

S1(config)# **exit**

%SYS-5-CONFIG_I: Configured from console by console

S1#

When will this banner be displayed?

<u>At the very initial login of the switch, whenever someone attempts to log onto the switch</u>

Why should every switch have a MOTD banner?

<u>Because it can display any important messages to the client whenever they login</u>

Part 7:   Save Configuration Files to NVRAM
Step 1:   Verify that the configuration is accurate using the show run command.
Step 2:   Save the configuration file.

You have completed the basic configuration of the switch. Now back up the running configuration file to NVRAM to ensure that the changes made are not lost if the system is rebooted or loses power.

S1# **copy running-config startup-config**

Destination filename [startup-config]?**[Enter]**

Building configuration...

[OK]

What is the shortest, abbreviated version of the **copy running-config startup-config** command? <u>run-con start-con</u>

Step 3:   Examine the startup configuration file.

Which command will display the contents of NVRAM? <u>show running-config</u>

Are all the changes that were entered recorded in the file? <u>yes</u>

Part 8:   Configure S2

You have completed the configuration on S1. You will now configure S2. If you cannot remember the commands, refer to Parts 1 to 4 for assistance.

Configure S2 with the following parameters:

    a. Name device: **S2**

    b. Protect access to the console using the **letmein** password.

    c. Configure an enable password of **c1$c0** and an enable secret password of **itsasecret**.

    d. Configure a message to those logging into the switch with the following message:

        Authorized access only. Unauthorized access is prohibited and violators will be prosecuted to the full extent of the law.

    e. Encrypt all plain text passwords.

    f. Ensure that the configuration is correct.

    g. Save the configuration file to avoid loss if the switch is powered down.

Lab# 2.3: - Implement Basic Connectivity

Topology
Addressing Table

Device	Interface	IP Address	Subnet Mask
S1	VLAN 1	192.168.1.253	255.255.255.0
S2	VLAN 1	192.168.1.254	255.255.255.0
PC-A	NIC	192.168.1.1	255.255.255.0
PC-**B**	NIC	192.168.1.2	255.255.255.0

Objectives

    Part 1: Perform a Basic Configuration on S1 and S2

    Part 2: Configure the PCs

    Part 3: Configure the Switch Management Interface

Background

In this activity you will first perform basic switch configurations. Then you will implement basic connectivity by configuring IP addressing on switches and PCs. When the IP addressing configuration is complete, you will use various **show** commands to verify configurations and use the **ping** command to verify basic connectivity between devices.

Part 9:   Perform a Basic Configuration on S1 and S2

Complete the following steps on S1 and S2.

Step 1:   Configure S1 with a hostname.

    a.   Click **S1**, and then click the **CLI** tab.

    b.   Enter the correct command to configure the hostname as **S1**.

Step 2:   Configure the console and privileged EXEC mode passwords.

    a.   Use **cisco** for the console password.

    b.   Use **class** for the privileged EXEC mode password.

Step 3:   Verify the password configurations for S1.

How can you verify that both passwords were configured correctly?

Basically exiting out of both modes (right to the startup mode), we will get a prompt of enter password for exec mode then type enable in the exec, we will get prompt of enter password for user-privileged mode. That is how we can verify that both passwords were configured correctly

Step 4:   Configure a message of the day (MOTD) banner.

Use an appropriate banner text to warn unauthorized access. The following text is an example:

Authorized access only. Violators will be prosecuted to the full extent of the law.

Step 5:   Save the configuration file to NVRAM.

Which command do you issue to accomplish this step?
 copy running-config startup-config

Step 6:   Repeat Steps 1 to 5 for S2.

Part 10: Configure the PCs

Configure PC1 and PC2 with IP addresses.

Step 1:   Configure both PCs with IP addresses.

a.   Click **PC-A**, and then click the **Desktop** tab.

b.   Click **IP Configuration**. In the **Addressing Table** above, you can see that the IP address for PC1 is 192.168.1.1 and the subnet mask is 255.255.255.0. Enter this information for PC1 in the **IP Configuration** window.

c.   Repeat steps 1a and 1b for PC-B.

Step 2:   Test connectivity to switches.

a.   Click **PC1**. Close the **IP Configuration** window if it is still open. In the **Desktop** tab, click **Command Prompt**.
.

b.   Type the **ping** command and the IP address for S1, and press **Enter**.
Packet Tracer PC Command Line 1.0
PC> **ping 192.168.1.253**

Were you successful? Why or why not?

We were not successful because there is no such as ip like that configured on our network, it could be the ip of the S1 but we have not configured it yet so it cannot reach it for now.

Part 11: Configure the Switch Management Interface

Configure S1 and S2 with an IP address.

Step 1: Configure S1 with an IP address. Also configure Virtual Terminal Line (VTY):

Switches can be used as a plug-and-play device, meaning they do not need to be configured for them to work. Switches forward information from one port to another based on Media Access Control (MAC) addresses. If this is the case, why would we configure it with an IP address?

To connect remotely to a switch, you need to assign an IP address to it. The default configuration on the switch is to have the management of the switch controlled through VLAN 1.

a. Use the following commands to configure S1 with an IP

address. S1 #**configure terminal**

Enter configuration commands, one per line. End with CNTL/Z.
S1(config)# **interface vlan 1**
S1(config-if)# **ip address 192.168.1.253 255.255.255.0**
S1(config-if)# **no shutdown**
%LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to
up S1(config-if)#
S1(config-if)# **exit**
S1#

Why do you need to enter the **no shutdown** command?

To change the VLAN 1 interface state to active.

b. Configure the virtual terminal (VTY) line for the switch to allow Telnet access. If you do not configure a VTY password, you will not be able to Telnet to the switch.

```
S1(config)# line vty 0 4
S1(config-line)# password
cisco S1(config-line)# login
S1(config-line)# end
S1#
```

Step 2: Configure S2 with an IP addresses.

Use the information in the addressing table to configure S2 with an IP address.

Step 3: Verify the IP address configuration on S1 and S2.

Use the **show ip interface brief** command to display the IP address and status of the all the switch ports and interfaces. Alternatively, you can also use the **show running-config** command.

Step 4: Save configurations for S1 and S2 to NVRAM.

Which command is used to save the configuration file in RAM to NVRAM? _copy running-config startup-config_

Step 5: Verify network connectivity.

Network connectivity can be verified using the **ping** command. It is very important that connectivity exists throughout the network. Corrective action must be taken if there is a failure. Ping S1's and S2's IP address from PC1 and PC2.

a. Click **PC-A**, and then click the **Desktop** tab.

b. Click **Command Prompt**

c. Ping the IP address for PC-B.

d. Ping the IP address for S1.

e. Ping the IP address for S2.

Note: You can also use the same **ping** command on the switch CLI and on PC-B.

All pings should be successful. If your first ping result is 80%, retry; it should now be 100%. You will learn why a ping may fail the first time later in your studies. If you are unable to ping any of the devices, recheck your configuration for errors.
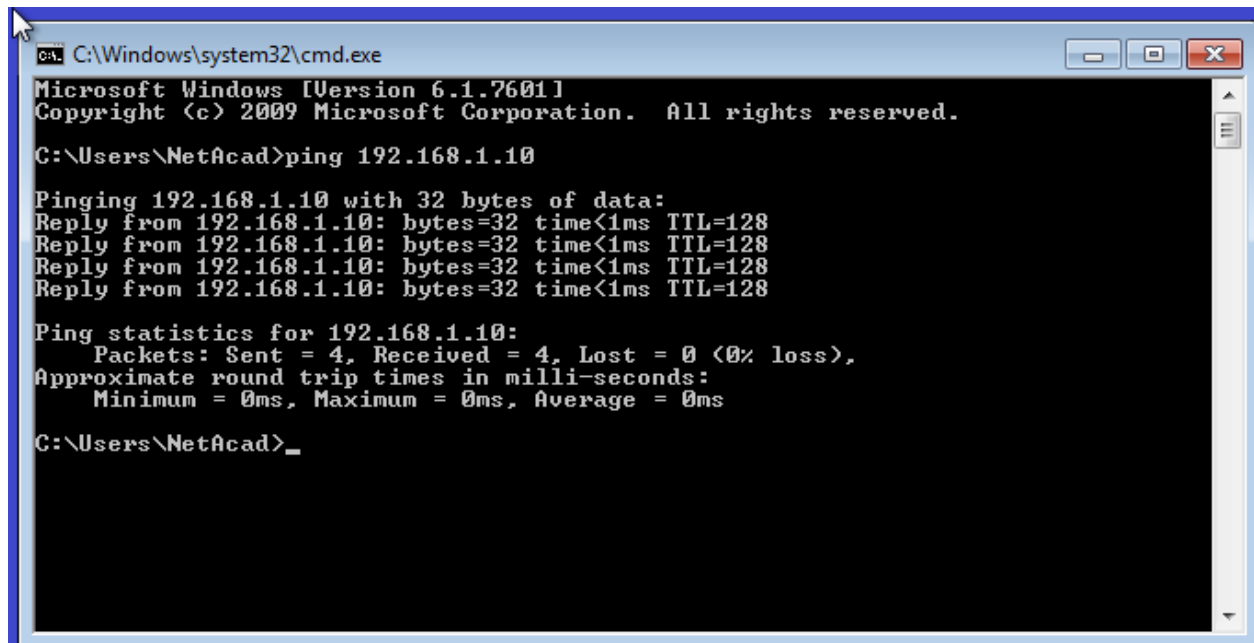

Step 6:   Test end-to-end connectivity.

Open a command prompt window (cmd.exe) on PC-A by clicking the **Windows Start** icon and enter **cmd** into the **Search for programs and files** field. Verify the IP address of PC-A by using the **ipconfig /all** command. This command displays the PC hostname and the IPv4 address information. Ping PC-A's own address and the management address of S1.

a.   Ping your own PC-A address first.

C:\Users\NetAcad> **ping**

192.168.1.1

Your output should be similar to the following screen:

```
C:\Windows\system32\cmd.exe

Microsoft Windows [Version 6.1.7601]
Copyright (c) 2009 Microsoft Corporation.  All rights reserved.

C:\Users\NetAcad>ping 192.168.1.10

Pinging 192.168.1.10 with 32 bytes of data:
Reply from 192.168.1.10: bytes=32 time<1ms TTL=128
Reply from 192.168.1.10: bytes=32 time<1ms TTL=128
Reply from 192.168.1.10: bytes=32 time<1ms TTL=128
Reply from 192.168.1.10: bytes=32 time<1ms TTL=128

Ping statistics for 192.168.1.10:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0ms

C:\Users\NetAcad>_
```

b.   Ping the SVI management address of

S1. C:\Users\NetAcad> **ping 192.168.1.2**

Your output should be similar to the following screen. If ping results are not successful, troubleshoot the basic device configurations. You should check both the physical cabling and IP addressing, if necessary.

```
C:\Users\NetAcad>
C:\Users\NetAcad>ping 192.168.1.2

Pinging 192.168.1.2 with 32 bytes of data:
Request timed out.
Reply from 192.168.1.2: bytes=32 time=2ms TTL=255
Reply from 192.168.1.2: bytes=32 time=2ms TTL=255
Reply from 192.168.1.2: bytes=32 time<1ms TTL=255

Ping statistics for 192.168.1.2:
    Packets: Sent = 4, Received = 3, Lost = 1 (25% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 2ms, Average = 1ms

C:\Users\NetAcad>_
```
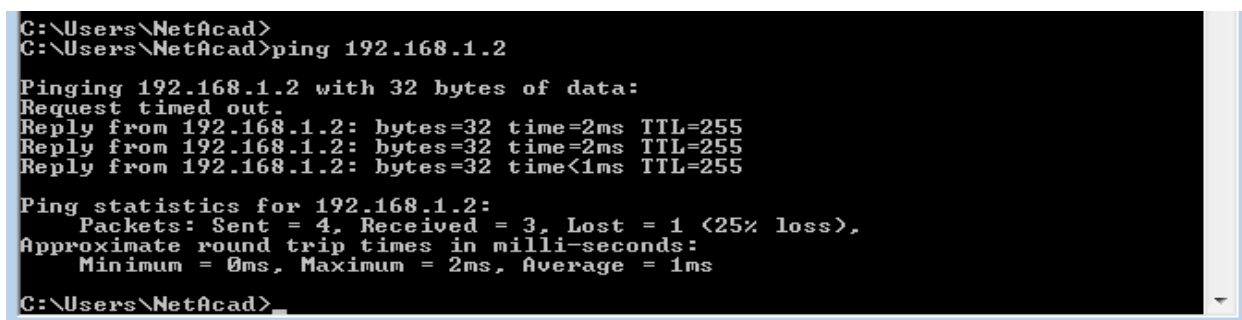

Step 7:   Test and verify remote management of S1.

You will now use Telnet to remotely access the switch S1 using the SVI management address. In this lab, PC-A and S1 reside side by side. In a production network, the switch could be in a wiring closet on the top floor while your management PC is located on the ground floor. Telnet is not a secure protocol. However, you will use it in this lab to test remote access. All information sent by Telnet, including passwords and commands, is sent across the session in plain text. In subsequent labs, you will use Secure Shell (SSH) to remotely access network devices.

Note: Windows 7 does not natively support Telnet. The administrator must enable this protocol. To install the Telnet client, open a command prompt window and type **pkgmgr /iu:"TelnetClient"**.

C:\Users\NetAcad> **pkgmgr /iu:"TelnetClient"**

a.   With the command prompt window still open on PC-A, issue a Telnet command to connect to S1 via the SVI management address. The password is **cisco**.

C:\Users\NetAcad> **telnet 192.168.1.253**

Your output should be similar to the following screen:

```
Telnet 192.168.1.2

Unauthorized access is strictly prohibited.
User Access Verification

Password: _
```

b.   After entering the **cisco** password, you will be at the user EXEC mode prompt. Type **enable** at the prompt. Enter the **class** password to enter privileged EXEC mode and issue a **show run** command.

Reflection

Why must you use a console connection to initially configure the switch? Why not connect to the switch via Telnet or SSH?

Because there is no ip configuration in the switch initially so connecting the switch via console to configure it is the only method. Once you configured the ip of the switch you can then use telnet or SSH to remotely configure it

Lab# 2.1:- Packet Tracer - Navigating the two different networks.

Topology
Figure 3.1

Objectives

Part 1: Connections using copper straight through wires.

Part 2: Accessing the CLI of each network device to do basic configuration.

Part 3: Assign IP address to each device and router's interfaces.

Part 4: Configure telnet on each network device.

Part 5: Set default gateways.

Part 6: Verify Network Connectivity by using PING.

Part 7: Establish telnet session to each network device via command prompt of different PCs.

Part 8: Home activity.

Part 1: Basic Connections, Accessing the CLI and Exploring Help

In Part 1 of this activity, you connect the all the devices together using copper straight through connection as mentioned in figure 3.1.

Connect PC1 to S1 using a console cable.

a. Click the **Connections** icon (the one that looks like a lightning bolt) in the lower left corner of the Packet Tracer window.

b. Select the black copper straight through cable by clicking it. The mouse pointer will change to what appears to be a connector with a cable dangling off of it.

c. Click on **PC1**; a window displays an option for a fast Ethernet connection.

d. Drag the other end of the copper straight through connection to the S1 switch and click the switch to bring up the connection list.

e. Select the Fast Ethernet 0/1 port to complete the connection.

f. Click on **PC2**; a window displays an option for a fast Ethernet connection.

g. Drag the other end of the copper straight through connection to the S1 switch and click the switch to bring up the connection list.

h. Select the Fast Ethernet 0/2 port to complete the connection.

i. Click on **PC3**; a window displays an option for a fast Ethernet connection.

j. Drag the other end of the copper straight through connection to the S1 switch and click the switch to bring up the connection list.

k. Select the Fast Ethernet 0/3 port to complete the connection.

l. Click on **PC-A**; a window displays an option for a fast Ethernet connection.

m. Drag the other end of the copper straight through connection to the S2 switch and click the switch to bring up the connection list.

n. Select the Fast Ethernet 0/1 port to complete the connection.

o. Click on **PC-B**; a window displays an option for a fast Ethernet connection.

p. Drag the other end of the copper straight through connection to the S2 switch and click the switch to bring up the connection list.

q. Select the Fast Ethernet 0/2 port to complete the connection.

r. Click on **R router**; a window displays some option for Gigabit Ethernet or fast Ethernet ports. Select the Fast Ethernet 0/0 or Gigabit Ethernet 0/0.

s. Drag the other end of the copper straight through connection to the S1 switch and click the switch to bring up the connection list.

t. Select the Fast Ethernet 0/24 port to complete the connection.

u. Again Click on **R router**; a window displays some option for Gigabit Ethernet or fast Ethernet ports. Select the Fast Ethernet 0/1 or Gigabit Ethernet 0/1.

v. Drag the other end of the copper straight through connection to the S2 switch and click the switch to bring up the connection list.

w. Select the Fast Ethernet 0/24 port to complete the connection.

Part 2: Accessing the CLI of each network device to do basic configuration.

- Click on **S1switch** and then select the CLI tab to access the CISCO IOS.

- Do some basic configurations like setting the clock, assign name to each network device, set banner, console password, privilege mode password or enable secret and encrypt them.

Step 1: Assign a name to a switch.

To configure parameters on a switch, you may be required to move between various configuration modes. Notice how the prompt changes as you navigate through the switch.

> Switch# **clock set 15:00:00 31 Jan 2035**
> Switch# **configure terminal**
> Switch(config)# **hostname S1**
> S1(config)# **exit**
> S1#

Step 2:   Secure access to the console line.

To secure access to the console line, access config-line mode and set the console password to **letmein**.

> S1# **configure terminal**
> Enter configuration commands, one per line. End with CNTL/Z.
> S1(config)# **line console 0**
>
> S1(config-line)# **password letmein**
> S1(config-line)#
> **login**
> S1(config-line)# **exit**
> S1(config)# **exit**
> %SYS-5-CONFIG_I: Configured from console by console
> S1#

Step 3: Verify that console access is secured.

Exit privileged mode to verify that the console port password is in effect.

S1# **exit**

Switch con0 is now available

Press RETURN to get started.

User Access Verification

Password:

S1>

Note: If the switch did not prompt you for a password, then you did not configure the **login** parameter in Step 2.

Step 4: Secure privileged mode access.

Set the **enable** password to **c1$c0**. This password protects access to privileged mode.

Note: The **0** in **c1$c0** is a zero, not a capital O. This password will not grade as correct until after you encrypt it in Step 8.

S1> **enable**

S1# **configure terminal**

S1(config)# **enable password**

c1$c0 S1(config)# **exit**

%SYS-5-CONFIG_I: Configured from console by console

S1#

Step 5: Verify that privileged mode access is secure.

a. Enter the **exit** command again to log out of the switch.
b. Press **<Enter>** and you will now be asked for a
   password: User Access Verification

   Password:

c. The first password is the console password you configured for **line con 0**. Enter this password to return to user EXEC mode.

d. Enter the command to access privileged mode.

e. Enter the second password you configured to protect privileged EXEC mode.

f. Verify your configurations by examining the contents of the running-configuration file:

   S1# **show running-config**

   Notice how the console and enable passwords are both in plain text. This could pose a security risk if someone is looking over your shoulder.

Step 6: Configure an encrypted password to secure access to privileged mode.

The **enable password** should be replaced with the newer encrypted secret password using the **enable secret** command. Set the enable secret password to **itsasecret**.

S1# **config t**

S1(config)# **enable secret itsasecret**

S1(config)# **exit**

S1#

Note: The **enable secret** password overrides the **enable** password. If both are configured on the switch, you must enter the **enable secret** password to enter privileged EXEC mode.

Step 7: Verify that the enable secret password is added to the configuration file.

a. Enter the **show running-config** command again to verify the new **enable secret** password is configured.

   Note: You can abbreviate **show running-config** as

   S1# **show run**

Step 8: Encrypt the enable and console passwords.

As you noticed in Step 7, the **enable secret** password was encrypted, but the **enable** and **console** passwords were still in plain text. We will now encrypt these plain text passwords using the **service password-encryption** command.

   S1# **config t**
   S1(config)# **service password-encryption**
   S1(config)# **exit**

Configure a MOTD Banner

Step 9: Configure a message of the day (MOTD) banner.

The Cisco IOS command set includes a feature that allows you to configure messages that anyone logging onto the switch sees. These messages are called message of the day, or MOTD banners. Enclose the banner text in quotations or use a delimiter different from any character appearing in the MOTD string.

   S1# **config t**
   S1(config)# **banner motd "This is a secure system. Authorized Access Only!"**
   S1(config)# **exit**
   %SYS-5-CONFIG_I: Configured from console by console
   S1#

Step 10: Save Configuration Files to NVRAM

- **Verify that the configuration is accurate using the show run command.**

- **Save the configuration file.**

You have completed the basic configuration of the switch. Now back up the running configuration file to NVRAM to ensure that the changes made are not lost if the system is rebooted or loses power.

   S1# **copy running-config startup-config**
   Destination filename [startup-config]?**[Enter]**
   Building configuration...
   [OK]

Configure Router (R) and Switch2 (S2):

You have completed the configuration on S1. You will now configure S2. If you cannot remember the commands, refer to Step 1 to 10 for assistance.

Configure S2 with the following parameters:

a. Name device: **S2**

b. Protect access to the console using the **letmein** password.

c. Configure an enable password of **c1$c0** and an enable secret password of **itsasecret**.

d. Configure a message to those logging into the switch with the following message:

Authorized access only. Unauthorized access is prohibited and violators will be prosecuted to the full extent of the law.

e. Encrypt all plain text passwords.

f. Ensure that the configuration is correct.

g. Save the configuration file to avoid loss if the switch is powered down.

Part 3 and 4: - Implement Basic Addressing and Connectivity

Addressing Table

Device	Interface	IP Address	Subnet Mask	Default Gateway
R	Gi 0/0	192.168.1.1	255.255.255.0	---
R	Gi 0/1	172.16.5.1	255.255.0.0	---
S1	VLAN 1	192.168.1.2	255.255.255.0	192.168.1.1
S2	VLAN 1	172.16.5.2	255.255.0.0	172.16.5.1
PC-A	NIC	172.16.5.3	255.255.0.0	172.16.5.1
PC-**B**	NIC	172.16.5.4	255.255.0.0	172.16.5.1
PC1	NIC	192.168.1.3	255.255.255.0	192.168.1.1
PC2	NIC	192.168.1.4	255.255.255.0	192.168.1.1
PC2	NIC	192.168.1.4	255.255.255.0	192.168.1.1

table 3.1

Configure the PCs

Configure PC1, PC2 and PC3 with IP addresses, subnet mask and default gateway.

Step 1:   Configure both PCs with IP addresses.

a. Click **PC-A**, and then click the **Desktop** tab.

b. Click **IP Configuration**. In the **Addressing Table** above, you can see that the IP address for PC1 is 172.16.5.3, the subnet mask is 255.255.0.0 and the default gateway is 172.16.5.1. Enter these information for PC-A in the **IP Configuration** window.

c. Repeat steps 1a and 1b for PC-B, PC1, PC2 and PC3.

Configure the Switch Management Interface

Configure S1 and S2 with an IP address.

Step 2: Configure S1 with an IP address. Also configure Virtual Terminal Line (VTY):

     a.   Use the following commands to configure S1 with an IP address.

S1 #**configure terminal**

Enter configuration commands, one per line. End with CNTL/Z.

S1(config)# **interface vlan 1**

S1(config-if)# **ip address 192.168.1.2 255.255.255.0**

S1(config-if)# **no shutdown**

%LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to

up S1(config-if)#

S1(config-if)# **exit**

S1#

  b. Configure the virtual terminal (VTY) line for the switch to allow Telnet access. If you do not configure a VTY password, you will not be able to Telnet to the switch.

```
S1(config)# line vty 0 4
S1(config-line)# password
cisco S1(config-line)# login
S1(config-line)# end
S1#
```

Step 2:   Configure S2 with an IP addresses.

    Use the information in the addressing table to configure S2 with an IP address.

Step 3:   Configure Router's (R) Interfaces with IP addresses.

R> enable

R # configure terminal

R (config) # interface gigabitEthernet 0/0

R(config-if)# **ip address 192.168.1.2 255.255.255.0**

R(config-if)# **no shutdown**

%LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to

up R(config-if)#

R(config-if)# **exit**

R (config) # interface gigabitEthernet 0/1

R(config-if)# **ip address 172.16.5.1 255.255.0.0**

R(config-if)# **no shutdown**

%LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to

up R(config-if)#

R(config-if)# **end**

R# copy run start

R#exit

Step 4:   Verify the IP address configuration on R, S1 and S2.

Use the **show ip interface brief** command to display the IP address and status of the all the switch ports and interfaces. Alternatively, you can also use the **show running-config** command.

Part 5: - Configure default gateway on both Switches (S1 and S2):

On switch, following command is used to configure default gateway

S1 >en

S1 # configure terminal

S1 (config)# ip default-gateway 192.168.1.1

S1 (config)#exit

S1 # copy run start

Likewise on S2:

S2 >en

S2 # configure terminal

S2 (config)# ip default-gateway 172.16.5.1

S2 (config)#exit

S2 # copy run start

Part 6: Verify Network Connectivity by using PING .

Network connectivity can be verified using the **ping** command. It is very important that connectivity exists throughout the network. Corrective action must be taken if there is a failure. Ping S1's and S2's IP address from PC1, PC2, PC3,PC-A and PC-B.

a.   Click **PC-A**, and then click the **Desktop** tab.

b.   Click **Command Prompt**.

c.   Ping the IP address for PC-B.

d.   Ping the IP address for S1.

e.   Ping the IP address for S2.

f.   Ping the IP address of default gateway.

g.   Ping the IP address for PC1.

h.   Ping the IP address for PC2.

i.   Ping the IP address for PC3.

Note: You can also use the same **ping** command on the switch CLI and on PCs.

All pings should be successful. If your first ping result is 80%, retry; it should now be 100%. You will learn why a ping may fail the first time later in your studies. If you are unable to ping any of the devices, recheck your configuration for errors.

Part 7: Test and verify remote management of S1.

You will now use Telnet to remotely access the switch S1 using the SVI management address. In this lab, PC-A and S1 reside side by side. In a production network, the switch could be in a wiring closet on the top floor while your management PC is located on the ground floor. Telnet is not a secure protocol. However, you will use it in this lab to test remote access. All information sent by Telnet, including passwords and commands, is sent across the session in plain text. In subsequent labs, you will use Secure Shell (SSH) to remotely access network devices.

Note: Windows 7 does not natively support Telnet. The administrator must enable this protocol. To install the Telnet client, open a command prompt window and type **pkgmgr /iu:"TelnetClient"**.

   C:\Users\NetAcad> **pkgmgr /iu:"TelnetClient"**

j.   With the command prompt window still open on PC-A, issue a Telnet command to connect to S1 via the SVI management address. The password is **cisco**.

k.

   C:\Users\NetAcad> **telnet 192.168.1.2**

   Your output should be similar to the following screen:
l.   After entering the **cisco** password, you will be at the user EXEC mode prompt. Type **enable** at the prompt. Enter the **class** password to enter privileged EXEC mode and issue a **show run** command.

Part 8: Home Activity:

Complete the addressing table of the given topology. Configure a following topology in the light of experiment#3 by using c2911(router). Attach the screen shots of the **topology**, **addressing table** and **startup configuration of each intermediary device** at end of this experiment.

Experiment#04

Lab# 4.1:- Packet Tracer – Router as DHCP server.

Topology

192.168.1.0/24
Figure 4.1

Objectives

Part 1: Connections using copper straight through wires.

Part 2: Accessing the CLI of each network device to do basic configuration. Part 3: Assign IP Addresses to each network devices manually.

Part 4: Configure telnet on each network device.

Part 5: Configure a DHCPv4 server on a Router.

Part 6: Enable DHCP Services in PCs.

Part 7: Verify DHCP services

Part 8 Verify Network Connectivity by using PING. Part

9: Test and verify remote management of S1 and R. Part

10: Class activity.

Part 11: Home ativity.

Part 1: Basic Connections, Accessing the CLI and Exploring Help

In Part 1 of this activity, you connect the all the devices together using copper straight through connection as mentioned in figure 4.1.

Part 2: Accessing the CLI of each network device to do basic configuration.

- Click on S1 **switch** and then select the CLI tab to access the CISCO IOS.
- Do some basic configurations like setting the clock, assign host name to each network device, set banner, console password, privilege mode password or enable secret,virtual terminal line password and encrypt them.

Part 3 and 4: - Implement Basic Addressing on network devices manually.

Addressing Table

Device	Interface	IP Address	Subnet Mask	Default Gateway
R	Gi 0/0	192.168.1.1	255.255.255.0	---
S1	VLAN 1	192.168.1.2	255.255.255.0	192.168.1.1

table 4.1

Configure the Switch Management Interface

Configure S1 with an IP address.

Step 1: Configure S1 with an IP address. Also configure Virtual Terminal Line (VTY):

  a. Use the following commands to configure S1 with an IP address. S #**configure terminal**

Enter configuration commands, one per line. End with CNTL/Z.

S(config)# **interface vlan 1**

S(config-if)# **ip address 192.168.1.2 255.255.255.0**

S(config-if)# **no shutdown**

%LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to up S(config-if)#

S(config-if)# **exit**

S (config)# **ip default-gateway 192.168.1.1**

S (config)#**exit**

S # **copy run start**

S# **exit**

  b. Configure the virtual terminal (VTY) line for the switch to allow Telnet access. If you do not configure a VTY password, you will not be able to Telnet to the switch.

S1(config)# **line vty 0 15**

S1(config-line)# **password cisco**

S1(config-line)# **login**

S1(config-line)# **end**

S1#

Step 2: Configure Router's (R) Interfaces with IP addresses.

    a.   Use the following commands to configure S1 with an IP

address R> **enable**

R # **configure terminal**

R (config) # **interface gigabitEthernet 0/0**

R(config-if)# **ip address 192.168.1.1 255.255.255.0**

R(config-if)# **description connected to**
ACCOUNTS

R(config-if)# **no shutdown**

%LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to
up R(config-if)#

R(config-if)# **end**

R# **copy run start**

R#**exit**

    b.   Configure the virtual terminal (VTY) line for the Router (R) to allow Telnet access. If you do not configure
        a VTY password, you will not be able to Telnet to the switch.

R(config)# **line vty 0 15**
R(config-line)# **password cisco**
R(config-line)# **login**
R(config-line)# **end**
R# **copy run start**
R#**exit**
R#

Step 3: Verify the IP address configuration on Router (R) and Switch (S)

Use the **show ip interface brief** command to display the IP address and status of the all the switch ports and interfaces. Alternatively, you can also use the **show running-config** command.

Part 5: - Configure a DHCPv4 on Router:

R (config)# **service dhcp**

R (config)# **ip dhcp pool ACCONUTS**

R (dhcp-config)# **network 192.168.1.0 255.255.255.0**

R (dhcp-config)# **default-router 192.168.1.1**

R (dhcp-config)# **dns-server 8.8.8.8**

R (dhcp-config)# **exit**

R (config)# **ip dhcp excluded-address 192.168.1.1 192.168.1.2**

R (config)# **ex**

R # **write memory**

R#**ex**

Part 6: Enable DHCP Services in PCs.

Click on any PC then goes on DESKTOP tab then move to IP configuration and then check on DHCP. PC acquire IP configuration from DHCP automatically after a few moments. Repeat this for each PC in the topology for IP configuration.

Part 7: Verify DHCP services on R.

a.   On R, enter the **show ip dhcp binding** command to view DHCP address leases.

Along with the IP addresses that were leased, what other piece of useful client identification information is in the output?

The client hardware address of the clients that are connected to the network.

b.   On R, enter the **show ip dhcp server statistics** command to view the DHCP pool statistics and message activity.

How many types of DHCP messages are listed in the output?

command not displaying

c.   On R, enter the **show ip dhcp pool** command to view the DHCP pool settings.

In the output of the **show ip dhcp pool** command, what does the Current index refer to?

The next available ip address for dhcp to assign

d.   On R, enter the **show run | section dhcp** command to view the DHCP configuration in the running configuration.

Reflection

What do you think is the benefit of using DHCP relay agents instead of multiple routers acting as DHCP servers?

The benefit of using DHCP relay agents instead of multiple router to be acting as DHCP servers is that it can allow local hosts to acquire local IP addresses. Relay agents can receive DHCP messages and generate a new DHCP message to send out on another interface

Part 8: Verify network connectivity:

Network connectivity can be verified using the **ping** command. It is very important that connectivity exists throughout the network. Corrective action must be taken if there is a failure. Ping S1's and R IP address from each PCs.

  a. Click **PC-1**, and then click the **Desktop** tab.

  b. Click **Command Prompt**.

  c. Ping the IP address for PC-2.

  d. Ping the IP address for S1.

  e. Ping the IP address for R.

  f. Ping the IP address of default gateway.

  g. Ping the IP address for PC2.

  h. Ping the IP address for PC3.

Note: You can also use the same **ping** command on the switch CLI and on PCs.

All pings should be successful. If your first ping result is 80%, retry; it should now be 100%. You will learn why a ping may fail the first time later in your studies. If you are unable to ping any of the devices, recheck your configuration for errors.

Part 9: Test and verify remote management of S1 and R.

You will now use Telnet to remotely access the operating system of switch S1and router R.

Note: Windows 7 does not natively support Telnet. The administrator must enable this protocol. To install the Telnet client, open a command prompt window and type **pkgmgr /iu:"TelnetClient"**.

C:\Users\NetAcad> **pkgmgr /iu:"TelnetClient"**

With the command prompt window still open on PC-A, issue a Telnet command to connect to S1 via the SVI management address. The password is **cisco**.

C:\Users\NetAcad> **telnet 192.168.1.2**

Your output should be similar to the following screen:

After entering the **cisco** password, you will be at the user EXEC mode prompt. Type **enable** at the prompt. Enter the **class** password to enter privileged EXEC mode and issue a **show run** command.

Part 10: Class Activity

Configure the following topology in the light of above configuration by using Router 2911.
Step 1. **Configure Router (R):**

```
Router >en
Router# configure terminal
Router (config)# interface gi 0/0
Router (config-if)# ip address 192.168.1.1 255.255.255.0 Router (config-if)# description connected to FINANCE Router (config-if)# no shutdown
Router (config-if)#exit
Router (config)# interface gi 0/1
Router (config-if)# ip address 172.16.0.1 255.255.0.0
Router (config-if)# description connected to ENGINEERING
Router (config-if)# no shutdown
Router (config-if)#exit
Router (config)# interface gi 0/2
Router (config-if)# ip address 10.0.0.1 255.0.0.0
Router (config-if)# description connected to IT
Router (config-if)# no shutdown
Router (config-if)#exit

Router (config)#service DHCP
Router (config)# ip dhcp pool FINANCE
Router (dhcp-config)# network 192.168.1.0 255.255.255.0
Router (dhcp-config)# default-router 192.168.1.1
Router (dhcp-config)#dns-server 64.6.64.6
Router (dhcp-config)# exit
Router (config)#ip dhcp excluded-address 192.168.1.1 192.168.1.2

Router (config)# ip dhcp pool ENGINEERING
Router (dhcp-config)# network 172.16.0.0 255.255.0.0
Router (dhcp-config)# default-router 172.16.0.1
Router (dhcp-config)#dns-server 8.8.8.8
Router (dhcp-config)# exit
Router (config)#ip dhcp excluded-address 172.16.0.1 172.16.0.2
Router (config)# ip dhcp pool IT
Router (dhcp-config)# network 10.0.0.0 255.0.0.0
Router (dhcp-config)# default-router 10.0.0.1
Router (dhcp-config)#dns-server 64.6.65.6
Router (dhcp-config)# exit
Router (config)#ip dhcp excluded-address 10.0.0.1 10.0.0.2
Router (config)# hostname R
R (config)# banner motd " Warning !!! This is a secure system. Authorized Access Only!"
R(config)# line console 0
R(config-line)# password 123
R(config-line)#login
R(config-line)#exit
R(config)# line vty 0 15
R(config-line)# password 12345
R(config-line)#login
R(config-line)#exit
```

R(config)#**enable secret 1234**
R(config)# **service password-encryption**
R(config)#**exit**
R# **clock set 12:00:00 14 March 2017**
R# **write memory**

Step 2.   Configure Switch (S1):

Switch >**en**
Switch# **configure terminal**
Switch (config)# **interface vlan 1**
Switch   (config-if)#   **ip   address   192.168.1.2
255.255.255.0** Switch (config-if)# **description connected
to FINANCE** Switch (config-if)# **no shutdown**
Switch (config-if)#**exit**

Switch (config)# **hostname S1**
S1(config)# **banner motd " Warning !!! This is a secure system. Authorized Access Only!"**
S1(config)# **line console 0**
S1(config-line)# **password
123** S1(config-line)#**login**
S1(config-line)#**exit**
S1(config)# **line vty 0 15**
S1(config-line)# **password 12345**
S1(config-line)#**login**
S1(config-line)# **exit**
S1(config)#**enable secret 1234**
S1(config)# **service password-encryption**
S1(config)#**exit**
S1# **clock set 12:00:00 14 March 2017**
S1# **write memory**

Step 3.   Configure Switch (S2):

Switch >**en**
Switch# **configure terminal**
Switch (config)# **interface vlan 1**
Switch (config-if)# **ip address 172.16.0.2 255.255.0.0**
Switch (config-if)# **description connected to ENGINEERING**
Switch (config-if)# **no shutdown**
Switch (config-if)#**exit**

Switch (config)# **hostname S2**
S2(config)# **banner motd " Warning !!! This is a secure system. Authorized Access Only!"**
S2(config)# **line console 0**
S2(config-line)# **password
123** S2(config-line)#**login**
S2(config-line)#**exit**
S2(config)# **line vty 0 15**
S2(config-line)# **password 12345**
S2(config-line)#**login**
S2(config-line)# **exit**

```
S2(config)#enable secret 1234
S2(config)# service password-encryption
S2(config)#exit
S2# clock set 12:00:00 14 March 2017
S2# write memory
```

Step 4.   Configure Switch (S3):

```
Switch >en
Switch# configure terminal
Switch (config)# interface vlan 1
Switch (config-if)# ip address 10.0.0.2 255.0.0.0
Switch (config-if)# description connected to IT
Switch (config-if)# no shutdown
Switch (config-if)#exit

Switch (config)# hostname S3
S3(config)# banner motd " Warning !!! This is a secure system. Authorized Access Only!"
S3(config)# line console 0
S3(config-line)# password
123 S3(config-line)#login
S3(config-line)#exit
S3(config)# line vty 0 15
S3(config-line)# password 12345
S3(config-line)#login
S3(config-line)# exit
S3(config)#enable secret 1234
S3(config)# service password-encryption
S3(config)#exit
S3# clock set 12:00:00 14 March 2017
S3# write memory
```

Step 5.   Verify the above configuration

Click on any PC then goes on DESKTOP tab then move to IP configuration and then check on DHCP. PC acquire IP configuration from DHCP automatically after a few moments. Repeat this for each PC in the topology for IP configuration

Network connectivity can be verified using the **ping** command. It is very important that connectivity exists throughout the network. Corrective action must be taken if there is a failure. Ping S1's, S2's, and R's IP x`address from each PCs.

Verify DHCP services by using:

a.   On R, enter the **show ip dhcp binding** command to view DHCP address leases.

b.   On R, enter the **show ip dhcp server statistics** command to view the DHCP pool statistics and message activity.

c.   On R, enter the **show ip dhcp pool** command to view the DHCP pool settings.

d.   On R, enter the **show run | section dhcp** command to view the DHCP configuration in the running configuration.

You will now use Telnet to remotely access the operating system of switch S1 S2, S3 and router R.

Note: Windows 7 does not natively support Telnet. The administrator must enable this protocol. To install the Telnet client, open a command prompt window and type **pkgmgr /iu:"TelnetClient"**.

C:\Users\NetAcad> **pkgmgr /iu:"TelnetClient"**

With the command prompt window still open on PC-A, issue a Telnet command to connect to S1 via the SVI management address. The password is **cisco**.

C:\Users\NetAcad> **telnet 192.168.1.2**

Part 11: Home Activity

    Suppose there are two different departments which are connected together throw a router. Configure a following topology in the light of above experiment. Attach screen shot of the topology and printout of startup configuration of each intermediary device in the end of this lab manual.
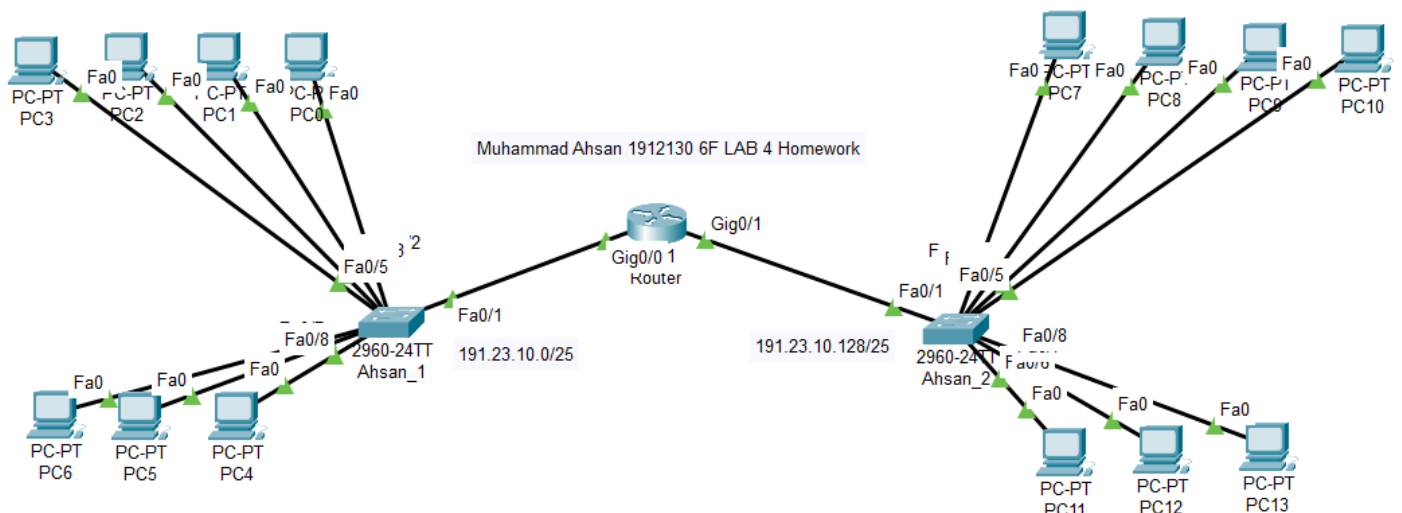

Device	interface	ip address	subnet mask	default gateway
Router 1912310	Gigabit 0/0	191.23.10.1	255.255.255.128	-
Router 1912310	Gigabit 0/1	191.23.10.129	255.255.255.128	-
Switch Ahsan_1	Vlan 1	191.23.10.2	255.255.255.128	191.23.10.1
Switch Ahsan_2	Vlan 1	191.23.10.130	255.255.255.128	191.23.10.129
PC0	FA 0/2	191.23.10.3	255.255.255.128	191.23.10.1
PC1	FA 0/3	191.23.10.4	255.255.255.128	191.23.10.1

Lab 5.1 - Configuring VLANs and Trunking

Topology
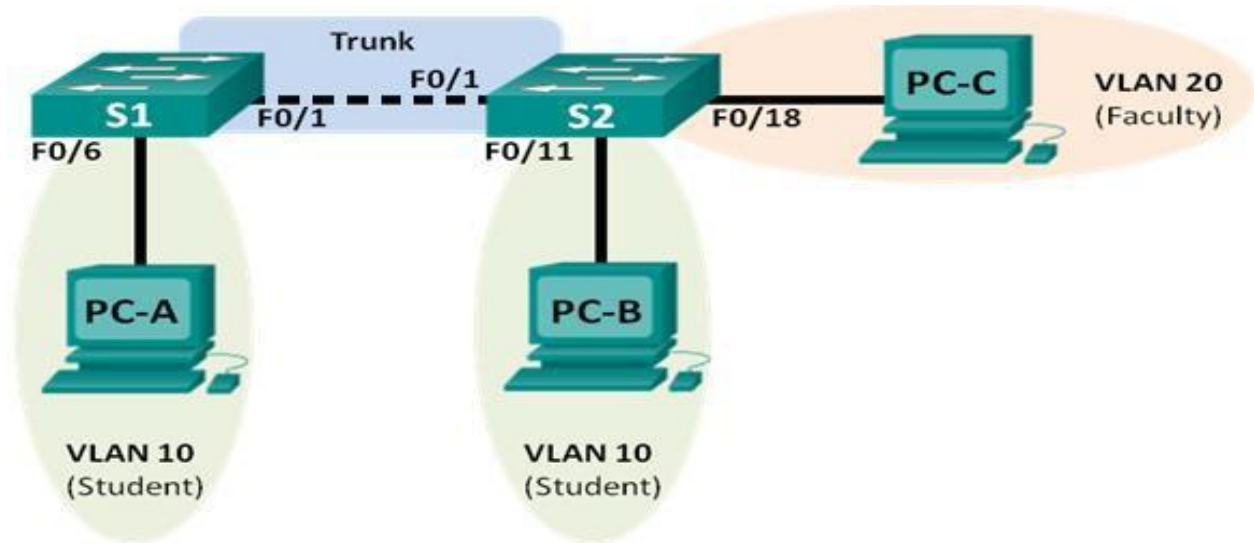

Figure:5.1.1

Addressing Table

Device	Interface	IP Address	Subnet Mask	Default Gateway
S1	VLAN 1	192.168.1.11	255.255.255.0	N/A
S2	VLAN 1	192.168.1.12	255.255.255.0	N/A
PC-A	NIC	192.168.10.3	255.255.255.0	192.168.10.1
PC-B	NIC	192.168.10.4	255.255.255.0	192.168.10.1
PC-C	NIC	192.168.20.3	255.255.255.0	192.168.20.1

table: 5.1.1

Objectives

    Part 1: Build the Network and Configure Basic Device Settings

    Part 2: Create VLANs and Assign Switch Ports

    Part 3: Maintain VLAN Port Assignments and the VLAN Database

    Part 4: Configure an 802.1Q Trunk between the Switches

    Part 5: Delete the VLAN Database

Background / Scenario

Modern switches use virtual local-area networks (VLANs) to improve network performance by separating large Layer 2 broadcast domains into smaller ones. VLANs can also be used as a security measure by controlling which hosts can communicate. In general, VLANs make it easier to design a network to support the goals of an organization.

VLAN trunks are used to span VLANs across multiple devices. Trunks allow the traffic from multiple VLANS to travel over a single link, while keeping the VLAN identification and segmentation intact

In this lab, you will create VLANs on both switches in the topology, assign VLANs to switch access ports, verify that VLANs are working as expected, and then create a VLAN trunk between the two switches to allow hosts in the same VLAN to communicate through the trunk, regardless of which switch the host is actually attached to.

Note: The switches used are Cisco Catalyst 2960s with Cisco IOS Release 15.0(2) (lanbasek9 image). Other switches and Cisco IOS versions can be used. Depending on the model and Cisco IOS version, the commands available and output produced might vary from what is shown in the labs.

Note: Ensure that the switches have been erased and have no startup configurations. If you are unsure contact your instructor.

Required Resources

- 2 Switches.
- 3 PCs (Windows 7, Vista, or XP with terminal emulation program, such as Tera Term)
- Console cables to configure the Cisco IOS devices via the console ports
- Ethernet cables as shown in the topology

Part 1:   Build the Network and Configure Basic Device Settings

In Part 1, you will set up the network topology and configure basic settings on the PC hosts and switches.

Step 1:   Cable the network as shown in the topology.

Attach the devices as shown in the topology diagram, and cable as necessary.

Step 2:   Initialize and reload the switches as necessary.

Step 3:   Configure basic settings for each switch.

a.   Disable DNS lookup.

b.   Configure device name as shown in the topology.

c.   Assign **class** as the privileged EXEC password.

d.   Assign **cisco** as the console and vty passwords and enable login for console and vty lines.

e.   Configure **logging synchronous** for the console line.

f.   Configure a MOTD banner to warn users that unauthorized access is prohibited.

g.   Configure the IP address listed in the Addressing Table for VLAN 1 on both switches.

h.   Administratively deactivate all unused ports on the switch.

i.   Copy the running configuration to the startup configuration.

Step 4:   Configure PC hosts.

Refer to the Addressing Table for PC host address information.

Step 5:   Test connectivity.

Verify that the PC hosts can ping one another.

Note: It may be necessary to disable the PCs firewall to ping between PCs.

Can PC-A ping PC-B?   <u>Yes</u>

Can PC-A ping PC-C?   <u>No</u>

Can PC-A ping S1?   <u>No</u>

Can PC-B ping PC-C?   <u>No</u>

Can PC-B ping S2?   <u>No</u>

Can PC-C ping S2?   <u>No</u>

Can S1 ping S2?   <u>Yes</u>

If you answered no to any of the above questions, why were the pings unsuccessful?

They were unsuccessful because they were trying to ping a device on a different subnet.
For those pings to be successful, a default gateway must exist to route traffic from one subnet to another.

Part 2:   Create VLANs and Assign Switch Ports

In Part 2, you will create student, faculty, and management VLANs on both switches. You will then assign the VLANs to the appropriate interface. The **show vlan** command is used to verify your configuration settings.

Step 1:   Create VLANs on the switches.

a.   Create the VLANs on S1.

S1(config)# **vlan 10**

S1(config-vlan)# **name Student**

S1(config-vlan)# **vlan 20**

S1(config-vlan)# **name Faculty**

S1(config-vlan)# **vlan 99**

S1(config-vlan)# **name Management**

S1(config-vlan)# **end**

b.   Create the same VLANs on S2.

c.   Issue the **show vlan** command to view the list of VLANs on

S1. S1# **show vlan**

VLAN Name	Status Ports
1 default	active Fa0/1, Fa0/2, Fa0/3, Fa0/4
	Fa0/5, Fa0/6, Fa0/7, Fa0/8
	Fa0/9, Fa0/10, Fa0/11, Fa0/12
	Fa0/13, Fa0/14, Fa0/15, Fa0/16
	Fa0/17, Fa0/18, Fa0/19, Fa0/20
	Fa0/21, Fa0/22, Fa0/23, Fa0/24
	Gi0/1, Gi0/2
10 Student	active
20 Faculty	active
99 Management	active
1002 fddi-default	act/unsup
1003 token-ring-default	act/unsup
1004 fddinet-default	act/unsup
1005 trnet-default	act/unsup

VLAN	Type	SAID	MTU	Parent	RingNo	BridgeNo	Stp	BrdgMode	Trans1	Trans2
1	enet	100001	1500	-	-	-	-	-	0	0
10	enet	100010	1500	-	-	-	-	-	0	0
20	enet	100020	1500	-	-	-	-	-	0	0
99	enet	100099	1500	-	-	-	-	-	0	0

VLAN Type SAID   MTU Parent RingNo BridgeNo Stp BrdgMode Trans1 Trans2

---- ------ --------- --- ---------------------------

VLAN	Type	SAID	MTU	Parent	RingNo	BridgeNo	Stp	BrdgMode	Trans1	Trans2
1002	fddi	101002	1500	-	-	-	-	-	0	0
1003	tr	101003	1500	-	-	-	-	-	0	0
1004	fdnet	101004	1500	-	-	-	ieee	-	0	0
1005	trnet	101005	1500	-	-	-	ibm	-	0	0

Remote SPAN VLANs

Primary Secondary Type   Ports

---- -------- ------------- --------------------------

What is the default VLAN? _VLAN 1_____

What ports are assigned to the default

VLAN?

All the ports are assigned to vlan 1 by default

Step 2:   Assign VLANs to the correct switch interfaces.

a. Assign VLANs to the interfaces on S1.
    1) Assign PC-A to the Student
       VLAN. S1(config)# **interface f0/6**
       S1(config-if)# **switchport mode access**
       S1(config-if)# **switchport access vlan**
       10 S1(config-if)# exit

    2) Move the switch IP address VLAN 99.

       S1(config)# **interface vlan 1**
       S1(config-if)# **no ip address**
       S1(config-if)# **interface vlan 99**
       S1(config-if)# **ip address 192.168.1.11 255.255.255.0**
       S1(config-if)# **end**

b. Issue the **show vlan brief** command and verify that the VLANs are assigned to the correct

   interfaces. S1# **show vlan brief**

   VLAN Name   Status Ports
   -
   1   default   active Fa0/1, Fa0/2, Fa0/3, Fa0/4
                                Fa0/5, Fa0/7, Fa0/8, Fa0/9
                                Fa0/10, Fa0/11, Fa0/12, Fa0/13
                                Fa0/14, Fa0/15, Fa0/16, Fa0/17
                                Fa0/18, Fa0/19, Fa0/20, Fa0/21
                                Fa0/22, Fa0/23, Fa0/24, Gi0/1
                                Gi0/2
   <mark>10 Student   active Fa0/6</mark>
   20   Faculty   active
   99 Management   active
   1002 fddi-default   act/unsup
   1003 token-ring-default   act/unsup
   1004 fddinet-default   act/unsup
   1005 trnet-default   act/unsup

c. Issue the **show ip interfaces brief**

   command. What is the status of VLAN 99?

   Why?

   The status of VLAN 99 is up/down, because it has not been assigned to an active port yet.

d. Use the Topology to assign VLANs to the appropriate ports on S2.

e. Remove the IP address for VLAN 1 on S2.

f. Configure an IP address for VLAN 99 on S2 according to the Addressing Table.

g. Use the **show vlan brief** command to verify that the VLANs are assigned to the correct interfaces. S2# **show vlan brief**

VLAN Name	Status Ports
1 default	active Fa0/1, Fa0/2, Fa0/3, Fa0/4
	Fa0/5, Fa0/6, Fa0/7, Fa0/8
	Fa0/9, Fa0/10, Fa0/12, Fa0/13
	Fa0/14, Fa0/15, Fa0/16, Fa0/17
	Fa0/19, Fa0/20, Fa0/21, Fa0/22
	Fa0/23, Fa0/24, Gi0/1, Gi0/2
10 Student	active Fa0/11
20 Faculty	active Fa0/18
99 Management	active
1002 fddi-default	act/unsup
1003 token-ring-default	act/unsup
1004 fddinet-default	act/unsup
1005 trnet-default	act/unsup

Is PC-A able to ping PC-B? Why?

 No. Interface Fa 0/1 is not assigned to VLAN 10, so VLAN 10 traffic will not be sent over it

Is S1 able to ping S2? Why?

No, because the IP address for the switches now are in VLAN 99. So it's traffic cannot be sent over Fa 0/1

Part 3:   Maintain VLAN Port Assignments and the VLAN Database

In Part 3, you will change VLAN assignments to ports and remove VLANs from the VLAN database.

Step 1:   Assign a VLAN to multiple interfaces.

a. On S1, assign interfaces F0/11 – 24 to VLAN

10. S1(config)# **interface range f0/11-24**
S1(config-if-range)# **switchport mode access**
S1(config-if-range)# **switchport access vlan 10**
S1(config-if-range)# **end**

b. Issue the **show vlan brief** command to verify VLAN assignments.

c. Reassign F0/11 and F0/21 to VLAN 20.

d. Verify that VLAN assignments are correct.

Step 2:   Remove a VLAN assignment from an interface.

a. Use the **no switchport access vlan** command to remove the VLAN 10 assignment to F0/24. S1(config)# **interface f0/24**
S1(config-if)# **no switchport access vlan**
S1(config-if)# **end**

b. Verify that the VLAN change was made. c. Which VLAN is F0/24 is now associated with? Vlan 1

Step 3: Remove a VLAN ID from the VLAN database.

a. Add VLAN 30 to interface F0/24 without issuing the VLAN command. S1(config)# **interface f0/24**

S1(config-if)# **switchport access vlan 30**

% Access VLAN does not exist. Creating vlan 30

Note: Current switch technology no longer requires that the **vlan** command be issued to add a VLAN to the database. By assigning an unknown VLAN to a port, the VLAN adds to the VLAN database.

b. Verify that the new VLAN is displayed in the VLAN table.

S1# **show vlan brief**

VLAN Name	Status	Ports
1 default	active	Fa0/1, Fa0/2, Fa0/3, Fa0/4
		Fa0/5, Fa0/6, Fa0/7, Fa0/8
		Fa0/9, Fa0/10, Gi0/1, Gi0/2
10 Student	active	Fa0/12, Fa0/13, Fa0/14, Fa0/15
		Fa0/16, Fa0/17, Fa0/18, Fa0/19
		Fa0/20, Fa0/22, Fa0/23
20 Faculty	active	Fa0/11, Fa0/21
30 VLAN0030	active	Fa0/24
99 Management	active	
1002 fddi-default	act/unsup	
1003 token-ring-default	act/unsup	
1004 fddinet-default	act/unsup	
1005 trnet-default	act/unsup	

What is the default name of VLAN 30? __VLAN0030____

c. Use the **no vlan 30** command to remove VLAN 30 from the VLAN database. S1(config)# **no vlan 30**

S1(config)# **end**

d. Issue the **show vlan brief** command. F0/24 was assigned to VLAN 30.

After deleting VLAN 30, what VLAN is port F0/24 assigned to? What happens to the traffic destined to the host attached to F0/24?

It will not be assigned to any VLAN and traffic will not be transferred by this port anymore.

S1# **show vlan brief**

VLAN Name	Status	Ports
1 default	active	Fa0/1, Fa0/2, Fa0/3, Fa0/4
		Fa0/5, Fa0/6, Fa0/7, Fa0/8
		Fa0/9, Fa0/10, Gi0/1, Gi0/2
10 Student	active	Fa0/12, Fa0/13, Fa0/14, Fa0/15
		Fa0/16, Fa0/17, Fa0/18, Fa0/19
		Fa0/20, Fa0/22, Fa0/23
20 Faculty	active	Fa0/11, Fa0/21
99 Management	active	
1002 fddi-default	act/unsup	
1003 token-ring-default	act/unsup	
1004 fddinet-default	act/unsup	
1005 trnet-default	act/unsup	

e. Issue the **no switchport access vlan** command on interface F0/24.

f. Issue the **show vlan brief** command to determine the VLAN assignment for F0/24. To which VLAN is F0/24 assigned?

VLAN1

Note: Before removing a VLAN from the database, it is recommended that you reassign all the ports assigned to that VLAN.

Why should you reassign a port to another VLAN before removing the VLAN from the VLAN database?

Well they would be unavailable until they are assigned to any other VLAN, they will not show up in the database when we troubleshoot, so it can be difficult

Part 4: Configure an 802.1Q Trunk Between the Switches

In Part 4, you will configure interface F0/1 to use the Dynamic Trunking Protocol (DTP) to allow it to negotiate the trunk mode. After this has been accomplished and verified, you will disable DTP on interface F0/1 and manually configure it as a trunk.

Step 1: Use DTP to initiate trunking on F0/1.

The default DTP mode of a 2960 switch port is dynamic auto. This allows the interface to convert the link to a trunk if the neighboring interface is set to trunk or dynamic desirable mode.

a. Set F0/1 on S1 to negotiate trunk
mode. S1(config)# **interface f0/1**

S1(config-if)# **switchport mode dynamic desirable**

*Mar 1 05:07:28.746: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down

*Mar 1 05:07:29.744: %LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/1, changed state to down

S1(config-if)#

*Mar 1 05:07:32.772: %LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/1, changed state to up

S1(config-if)#

*Mar 1 05:08:01.789: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan99, changed state to up

*Mar 1 05:08:01.797: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to up

You should also receive link status messages on S2.

S2#

*Mar 1 05:07:29.794: %LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/1, changed state to down

S2#

*Mar 1 05:07:32.823: %LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/1, changed state to up

S2#

*Mar 1 05:08:01.839: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan99, changed state to up

*Mar 1 05:08:01.850: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to up

b. Issue the **show vlan brief** command on S1 and S2. Interface F0/1 is no longer assigned to VLAN 1. Trunked interfaces are not listed in the VLAN table.

S1# **show vlan brief**

VLAN	Name	Status	Ports
1	default	active	Fa0/2, Fa0/3, Fa0/4, Fa0/5
			Fa0/7, Fa0/8, Fa0/9, Fa0/10
			Fa0/24, Gi0/1, Gi0/2
10	Student	active	Fa0/6, Fa0/12, Fa0/13, Fa0/14
			Fa0/15, Fa0/16, Fa0/17, Fa0/18
			Fa0/19, Fa0/20, Fa0/22, Fa0/23
20	Faculty	active	Fa0/11, Fa0/21
99	Management	active	
1002	fddi-default	act/unsup	
1003	token-ring-default	act/unsup	
1004	fddinet-default	act/unsup	
1005	trnet-default	act/unsup	

c. Issue the **show interfaces trunk** command to view trunked interfaces. Notice that the mode on S1 is set to desirable, and the mode on S2 is set to auto.

S1# **show interfaces trunk**

Port	Mode	Encapsulation	Status	Native vlan
Fa0/1	desirable	802.1q	trunking	1

Port	Vlans allowed on trunk
Fa0/1	1-4094

Port	Vlans allowed and active in management
domain Fa0/1	1,10,20,99

Port	Vlans in spanning tree forwarding state and not
pruned Fa0/1	1,10,20,99

S2# **show interfaces trunk**

Port	Mode	Encapsulation	Status	Native vlan
Fa0/1	auto	802.1q	trunking	1

Port	Vlans allowed on trunk
Fa0/1	1-4094

Port	Vlans allowed and active in management
domain Fa0/1	1,10,20,99

Port	Vlans in spanning tree forwarding state and not
pruned Fa0/1	1,10,20,99

Note: By default, all VLANs are allowed on a trunk. The **switchport trunk** command allows you to control what VLANs have access to the trunk. For this lab, keep the default settings which allows all VLANs to traverse F0/1.

d. Verify that VLAN traffic is traveling over trunk interface F0/1.

Can S1 ping S2?   Yes

Can PC-A ping PC-B?   Yes

Can PC-A ping PC-C?   No

Can PC-B ping PC-C?   No

Can PC-A ping S1?   No

Can PC-B ping S2?   No

Can PC-C ping S2?   No

If you answered no to any of the above questions, explain below.

PC-C cannot ping PC-A or PC-B because PC-C is in a different VLAN. The switches are in different VLANs than the PCs; therefore, the pings were unsuccessful.

Step 2: Manually configure trunk interface F0/1.

The **switchport mode trunk** command is used to manually configure a port as a trunk. This command should be issued on both ends of the link.

a. Change the switchport mode on interface F0/1 to force trunking. Make sure to do this on both switches. S1(config)# **interface f0/1**

S1(config-if)# **switchport mode trunk**

b. Issue the **show interfaces trunk** command to view the trunk mode. Notice that the mode changed from **desirable** to **on**.

S2# **show interfaces trunk**

```
Port      Mode         Encapsulation Status      Native vlan
Fa0/1     on           802.1q      trunking     99

Port      Vlans allowed on trunk
Fa0/1     1-4094

Port      Vlans allowed and active in management
domain Fa0/1                1,10,20,99

Port      Vlans in spanning tree forwarding state and not
pruned Fa0/1               1,10,20,99
```

Why might you want to manually configure an interface to trunk mode instead of using DTP?

Not all equipment uses DTP. Using the **switchport mode trunk** command ensures that the port will become a trunk no matter what type of equipment is connected to the other end of the link.

Part 5: Delete the VLAN Database

In Part 5, you will delete the VLAN Database from the switch. It is necessary to do this when initializing a switch back to its default settings.

Step 1: Determine if the VLAN database exists.

Issue the **show flash** command to determine if a **vlan.dat** file exists in flash.

```
S1# show flash
Directory of flash:/
    2 -rwx      1285 Mar 1 1993 00:01:24 +00:00 config.text
    3 -rwx     43032 Mar 1 1993 00:01:24 +00:00 multiple-fs
    4 -rwx         5 Mar 1 1993 00:01:24 +00:00 private-config.text
    5 -rwx 11607161 Mar 1 1993 02:37:06 +00:00 c2960-lanbasek9-mz.150-2.SE.bin
    6 -rwx       736 Mar 1 1993 00:19:41 +00:00 vlan.dat

32514048 bytes total (20858880 bytes free)
```

Note: If there is a **vlan.dat** file located in flash, then the VLAN database does not contain its default settings.

Step 2:   Delete the VLAN database.

a.   Issue the **delete vlan.dat** command to delete the vlan.dat file from flash and reset the VLAN database back to its default settings. You will be prompted twice to confirm that you want to delete the vlan.dat file. Press Enter both times.

S1# delete vlan.dat

Delete filename [vlan.dat]?

Delete flash:/vlan.dat? [confirm]

S1#

b.   Issue the **show flash** command to verify that the vlan.dat file has been

deleted. S1# **show flash**

Directory of flash:/

    2 -rwx   1285 Mar 1 1993 00:01:24 +00:00 config.text
    3 -rwx   43032 Mar 1 1993 00:01:24 +00:00 multiple-fs
    4 -rwx   5 Mar 1 1993 00:01:24 +00:00 private-config.text
    5 -rwx 11607161 Mar 1 1993 02:37:06 +00:00 c2960-lanbasek9-mz.150-2.SE.bin

32514048 bytes total (20859904 bytes free)

To initialize a switch back to its default settings, what other commands are needed?

To initialize a switch back to it's default settings, the erase startup-config and reload commands need to be issued after the delete.vlan.dat commands

Reflection

1. What is needed to allow hosts on VLAN 10 to communicate to hosts on VLAN 20?

   Answers will vary, but Layer 3 routing is needed to route traffic between VLANs.

2. What are some primary benefits that an organization can receive through effective use of VLANs?

   Answers will vary, but VLAN benefits include: better security, cost savings (efficient use of bandwidth and uplinks), higher performance (smaller broadcast domains), broadcast storm mitigation, improved IT staff efficiency, simpler project and application management.

VLANs Table:

VLAN	Name
2	Faculty
3	ADMIN
4	Students

Table:5.2.2

VLANs Ports Assigning Table:

VLANs	Name	Switch port Number			
		device	Access Ports	device	Trunk Ports
2	Faculty	S1	fa 0/1 – fa 0/5	S1	Fast Ethernet 0/24
		S2	fa 0/1 – fa 0/4		
3	ADMIN	S1	fa 0/6 –fa 0/7	S2	Fast Ethernet 0/24
		S2	fa 0/5 – fa 0/9		
4	Students	S1	fa 0/8 – fa 0/23		
		S2	fa 0/10 – fa 0/23		

Table:5.2.3

Objectives

Part 1: Build the Network and Configure Basic Device Settings on both switches

Part 2: Create VLANs and Assign Switch Ports to VLANs

Part 3: Configure an 802.1Q Trunk between the Switches

Part 4: Verification

Part 1: Build the Network and Configure Basic Device Settings on both switches

Part 2: Create VLANs and Assign Switch Ports to VLANs.

Step 1: Creating VLANs on S1 by referring VLANs and ports assigning table [*Table:5*.2.3]

> S1# **configure terminal**
> S1(config) # **vlan 2**
> S1(config-vlan) # **name Faculty**
> S1(config) # **exit**
>
> S1(config) # **vlan 3**
> S1(config-vlan) # **name ADMIN**
> S1(config) # **exit**
>
> S1(config) # **vlan 4**
> S1(config-vlan) # **name Students**
> S1(config) # **exit**

Step 2: Assign a VLANs to multiple switch interfaces by referring VLANs and ports assigning table [*Table:5*.2.3]

      a.   On S1, assign interfaces F0/1 – fa 0/5 to VLAN

2. S1(config)# **interface range f0/1- fa 0/5**

S1(config-if-range)# **switchport mode access**

S1(config-if-range)# **switchport access vlan 2**

S1(config-if-range)# **exit**

      b.   On S1, assign interfaces F0/6 – fa 0/7 to VLAN 3.

S1(config)# **interface range f0/6- fa 0/7**

S1(config-if-range)# **switchport mode access**

S1(config-if-range)# **switchport access vlan 3**

S1(config-if-range)# **exit**

      c.   On S1, assign interfaces F0/8 – fa 0/23 to VLAN 4.

S1(config)# **interface range f0/8- fa 0/23**

S1(config-if-range)# **switchport mode access**

S1(config-if-range)# **switchport access vlan 4**

S1(config-if-range)# **end**

Step 3: Creating VLANs on S2 by using VLANs assigning table

      S2# **configure terminal**

      S2(config) # **vlan 2**

      S2(config-vlan) # **name Faculty**

      S2(config) # **exit**

      S2(config) # **vlan 3**

      S2(config-vlan) # **name ADMIN**

      S2(config) # **exit**

      S2(config) # **vlan 4**

      S2(config-vlan) # **name Students**

      S2(config) # **exit**

Step 4: Assign VLANs to multiple switch interfaces by referring VLANs and ports assigning table [*Table:5*.2.3]

      a.   On S2, assign interfaces F0/1 – fa 0/4to VLAN

2. S2(config)# **interface range f0/1- fa 0/4**

S2(config-if-range)# **switchport mode access**

S2(config-if-range)# **switchport access vlan 2**

S2(config-if-range)# **exit**

      b.   On S2, assign interfaces F0/5 – fa 0/9 to VLAN 3.

S2(config)# **interface range f0/5- fa 0/9**

S2(config-if-range)# **switchport mode access**

S2(config-if-range)# **switchport access vlan 3**

S2(config-if-range)# **exit**

c.   On S2, assign interfaces F0/10 – fa 0/23to VLAN 4.

S2(config)# **interface range f0/10- fa 0/23**
S2(config-if-range)# **switchport mode access**
S2(config-if-range)# **switchport access vlan 4**
S2(config-if-range)# **end**

Part 3: Configure an 802.1Q Trunk between the Switches

Step 1:   configure trunk interface F0/24 on S1

S1 (config) # **int fa 0/24**

S1 (config-if) # **Switchport mode trunk**

S1 (config-if) # **exit**

Step 2:   configure trunk interface F0/24 on S2

S2 (config) # **int fa 0/24**

S2 (config-if) # **Switchport mode trunk**

S2 (config-if) # **exit**

Part 4: Verifications

- Issue the **show vlan brief** command on S1 and S2. Interface F0/24 is no longer assigned to VLAN 1. Trunked interfaces are not listed in the VLAN table.

  S1# show vlan brief

  S2# show vlan brief

- Issue **show vlan brief** command on S1 and S2. It is used to verify how many VLAN exist on the switch and how many ports are assigned in different VLANs.

  S1# **show vlan brief**

  S2# **show vlan brief**

- Issue the **show interface switchport** command on both switches

Lab 5.3 – Home Activity

In the light of above experiments, Configure the following topology by using addressing table, VLAN and port assignment table.

Scenario

Suppose you are designing a small VLAN switched network for three floor of SZABIST 100 campus.

Fig:5.3.1

Addressing Table:

| Device	Interface	IP Address	Subnet Mask	Default Gateway
PC0	NIC	192.168.1.2	255.255.255.0	192.168.1.1
PC3	NIC	192.168.1.3	255.255.255.0	192.168.1.1
PC6	NIC	192.168.1.4	255.255.255.0	192.168.1.1
PC1	NIC	192.168.2.2	255.255.255.0	192.168.2.1
PC5	NIC	192.168.2.3	255.255.255.0	192.168.2.1
PC2	NIC	192.168.3.3	255.255.255.0	192.168.3.1
PC4	NIC	192.168.3.3	255.255.255.0	192.168.3.1
PC7	NIC	192.168.3.3	255.255.255.0	192.168.3.1

Table:5.3.1

VLANs and Ports Assigning Table:

VLANs	Name	Switchport Number		
		Access Ports		Trunk Ports
2	Faculty	S1	fa 0/1 – fa 0/5	S1 Fast Ethernet 0/24
		S2	fa 0/18 – fa 0/22	
		S3	fa 0/18 – fa 0/23	
3	ADMIN	S1	fa 0/6 –fa 0/12	S2 Fast Ethernet 0/23 / Fast Ethernet 0/24
		S2	——	
		S3	fa 0/14 – fa 0/17	
4	Students	S1	fa 0/13 – fa 0/23	S3 Fast Ethernet 0/24
		S2	fa 0/1 – fa 0/17	
		S3	fa 0/1 – fa 0/13	

Table:5.3.2

<u>***Note:***</u>

- Put the screen shot of your designed topology at the end of this experiment.
- Also attach the printout of startup configurations of each switch.

Lab 6.1 - Security Features on Switch

Topology:

Objectives:

Part 1: Configure general security features on S1.

Part 2: Configure and verify port security on S1.

Configure and Verify Security Features on S1

You will shut down unused ports, turn off certain services running on the switch, and configure port security based on MAC addresses. Switches can be subject to MAC address table overflow attacks, MAC spoofing attacks, and unauthorized connections to switch ports. You will configure port security to limit the number of MAC addresses that can be learned on a switch port and disable the port if that number is exceeded.

Note: To implementing security features on S1, please make sure that you should be established a console session or configure security features through console cable.

Step 1:   Configure general security features on S1.

a. Configure a message of the day (MOTD) banner on S1 with an appropriate security warning message.

b. Issue a **show ip interface brief** command on S1. What physical ports are up?

The ports that are up are fa 0/5 and fa0/6

c. Shut down all unused physical ports on the switch. Use the **interface range** command.
S1(config)# **interface range f0/1 – 4**
S1(config-if-range)# **shutdown**
S1(config-if-range)# **interface range f0/7 – 24**
S1(config-if-range)# **shutdown**
S1(config-if-range)# **interface range g0/1 – 2**
S1(config-if-range)# **shutdown**
S1(config-if-range)# **end**
S1#

d. Issue the **show ip interface brief** command on S1. What is the status of ports F0/1 to F0/4?

They are administratively down

Step 2:   Configure and verify port security on S1.

a. Record the R1 G0/1 MAC address. From the R1 CLI, use the **show interface g0/1** command and record the MAC address of the interface.

R1# **show interface g0/1**

GigabitEthernet0/1 is up, line protocol is up

  Hardware is CN Gigabit Ethernet, address is 30f7.0da3.1821 (bia 3047.0da3.1821)

What is the MAC address of the R1 G0/1 interface? 30f7.0da3.1821 _____

b. From the S1 CLI, issue a **show mac address-table** command from privileged EXEC mode. Find the dynamic entries for ports F0/5 and F0/6. Record them below.

F0/5 MAC address: 30f7.0da3.1821 _____

F0/6 MAC address: - _____

c. Configure basic port security.

Note: This procedure would normally be performed on all access ports on the switch. F0/5 is shown here as an example.

1) From the S1 CLI, enter interface configuration mode for the port that connects to

R1. S1(config)# **interface f0/5**

2) Shut down the port.

S1(config-if)# **shutdown**

3) Enable the switch port.

S1(config-if)# **no shutdown**
S1(config-if)# **end**

4) Enable port security on
F0/5. S1 (config) # **int fa**
0/5
S1(config-if)# **switchport mode access**
S1(config-if)# **switchport port-security**
S1(config-if)# **switchport port-security maximum 1**
S1(config-if)# **switchport port-security mac-address 0060.47ed.4873**
S1(config-if)# **switchport port-security violation shut down**
OR
S1(config-if)# **switchport port-security violation protect**
OR
S1(config-if)# **switchport port-security violation Restrict**

Note:

- Entering the **switchport port-security** command sets the maximum MAC addresses to 1 and the violation action to shutdown. The **switchport port-security maximum** and **switchport port-security violation** commands can be used to change the default behavior.

- There are three different modes of violation in terms of switch port security

    1. **Shutdown:** port will be administratively shutdown because of security violation.

    2. **Protect:** Port remains active after security violation occur but ignore that rogue MAC-Address

    3. **Restrict:** Port remains active after security violation occur but ignore that rogue MAC- Address and copy the information to the network monitoring system.

5) Configure a static entry for the MAC address of R1 G0/1 interface recorded in Step

   2a. S1(config-if)# switchport port-security mac-address xxxx.xxxx.xxxx

   (xxxx.xxxx.xxxx is the actual MAC address of the router G0/1 interface)

Note: Optionally, you can use the **switchport port-security mac-address sticky** command to add all the secure MAC addresses that are dynamically learned on a port (up to the maximum set) to the switch running configuration.

d. Verify port security on S1 F0/5 by issuing a **show port-security interface** command.

S1# **show port-security interface f0/5**

Port Security   : Enabled

Port Status   : Secure-up

Violation Mode   : Shutdown

Aging Time   : 0 mins

Aging Type   : Absolute

SecureStatic Address Aging : Disabled

Maximum MAC Addresses   1

Total MAC Addresses   1

Configured MAC Addresses   1

Sticky MAC Addresses   0

Last Source Address:Vlan : 0000.0000.0000:0

Security Violation Count   0

What is the port status of F0/5? Secure-up

e. From R1 command prompt, ping PC-A to verify connectivity.

R1# **ping 172.16.99.3**

f. You will now violate security by changing the MAC address on the router interface. Enter interface configuration mode for G0/1 and shut it down.

R1# **config t**

R1(config)# **interface g0/1**

R1(config-if)# **shutdown**

g. Configure a new MAC address for the interface, using **aaaa.bbbb.cccc** as the address.

R1(config-if)# **mac-address aaaa.bbbb.cccc**

h. If possible, have a console connection open on S1 at the same time that you do this step. You will see various messages displayed on the console connection to S1 indicating a security violation. Enable the G0/1 interface on R1.

R1(config-if)# **no shutdown**

i. From R1 privileged EXEC mode, ping PC-A. Was the ping successful? Why or why not?

Because the port Fa0/5 is shut down. So no, the ping was not successful.

j. On the switch, verify port security with the following commands shown below.

S1# **show port-security**

Secure Port MaxSecureAddr CurrentAddr SecurityViolation Security

        Action (Count)   (Count)   (Count)

    Fa0/5   1   1   1   Shutdown

Total Addresses in System (excluding one mac per port)   :0

Max Addresses limit in System (excluding one mac per port) :8192

S1# **show port-security interface f0/5**

Port Security   : Enabled

Port Status   :

Secure-shutdown Violation Mode

                 : Shutdown

Aging Time   : 0 mins

Aging Type   : Absolute

SecureStatic Address Aging : Disabled

Maximum MAC Addresses   1

Total MAC Addresses   1

Configured MAC Addresses   1

Sticky MAC Addresses   0

Last Source Address:Vlan : aaaa.bbbb.cccc:99

Security Violation Count   1

S1# **show interface f0/5**

<mark>FastEthernet0/5 is down, line protocol is down (err-disabled)</mark>

 Hardware is Fast Ethernet, address is 0cd9.96e2.3d05 (bia 0cd9.96e2.3d05)

 MTU 1500 bytes, BW 10000 Kbit/sec, DLY 1000 usec,

   reliability 255/255, txload 1/255, rxload 1/255

S1# **show port-security address**

         Secure Mac Address Table

Vlan   Mac Address   Type   Ports   Remaining Age
                                             (mins)

 ----   -----------   ----   ----   --------

 99   30f7.0da3.1821   SecureConfigured   Fa0/5   -

 Total Addresses in System (excluding one mac per port)   :0

 Max Addresses limit in System (excluding one mac per port) :8192

k. On the router, shut down the G0/1 interface, remove the hard-coded MAC address from the router, and re-enable the G0/1 interface.

   R1(config-if)# **shutdown**

   R1(config-if)# **no mac-address aaaa.bbbb.cccc**

   R1(config-if)# **no shutdown**

   R1(config-if)# **end**

l. From R1, ping PC-A again at 172.16.99.3. Was the ping successful? No it was not

m. On the Switch, issue the **show interface f0/5** command to determine the cause of ping failure. Record your findings. [The failure is happening because our port fa0/5 is in error disabled state that's why.]

n. Clear the S1 F0/5 error disabled

   status. S1# **config t**

   S1(config)# **interface f0/5**

   S1(config-if)# **shutdown**

   S1(config-if)# **no shutdown**

   Note: There may be a delay while the port states converge.

o. Issue the **show interface f0/5** command on S1 to verify F0/5 is no longer in error disabled mode. S1# **show interface f0/5**

<mark>FastEthernet0/5 is up, line protocol is up (connected)</mark>

 Hardware is Fast Ethernet, address is 0023.5d59.9185 (bia 0023.5d59.9185)

 MTU 1500 bytes, BW 100000 Kbit/sec, DLY 100 usec,

   reliability 255/255, txload 1/255, rxload 1/255

p. From the R1 command prompt, ping PC-A again. You should be successful.

Lab 6.2– Configuring 802.1Q Trunk-Based Inter-VLAN Routing

Topology

Device	Interface	IP Address	Subnet Mask	Default Gateway
R1	G0/0.1	192.168.1.1	255.255.255.0	N/A
	G0/0.10	192.168.10.1	255.255.255.0	N/A
	G0/0.20	192.168.20.1	255.255.255.0	N/A
S1	VLAN 1	192.168.1.11	255.255.255.0	192.168.1.1
S2	VLAN 1	192.168.1.12	255.255.255.0	192.168.1.1
PC-A	NIC	192.168.10.3	255.255.255.0	192.168.10.1
PC-B	NIC	192.168.20.3	255.255.255.0	192.168.20.1

Table: 6.2.1

Switch Port Assignment Specifications

Ports	Assignment	Network
S1 F0/_____	802.1Q Trunk	N/A
S2 F0/_____	802.1Q Trunk	N/A
S1 F0/_____	802.1Q Trunk	N/A
S1 F0/_____	VLAN 10 – Students	192.168.10.0/24
S2 F0/_____	VLAN 20 – Faculty	192.168.20.0/24

Table: 6.2.1

Objectives

Part 1: Build the Network and Configure Basic Device Settings

Part 2: Configure Switches with VLANs and Trunking

Part 3: Configure Trunk-Based Inter-VLAN Routing

Background / Scenario

A second method of providing routing and connectivity for multiple VLANs is through the use of an 802.1Q trunk between one or more switches and a single router interface. This method is also known as router-on-a-stick inter-VLAN routing. In this method, the physical router interface is divided into multiple subinterfaces that provide logical pathways to all VLANs connected.

In this lab, you will configure trunk-based inter-VLAN routing and verify connectivity to hosts on different VLANs as well as with a loopback on the router.

Note: This lab provides minimal assistance with the actual commands necessary to configure trunk-based inter-VLAN routing. However, the required configuration commands are provided in Appendix A of this lab. Test your knowledge by trying to configure the devices without referring to the appendix.

Note: The routers used with CCNA hands-on labs are Cisco 1941 Integrated Services Routers (ISRs) with Cisco IOS, Release 15.2(4)M3 (universalk9 image). The switches used are Cisco Catalyst 2960s with Cisco IOS, Release 15.0(2) (lanbasek9 image). Other routers, switches and Cisco IOS versions can be used. Depending on the model and Cisco IOS version, the commands available and output produced might vary from what is shown in the labs. Refer to the Router Interface Summary Table at the end of the lab for the correct interface identifiers.

Note: Make sure that the routers and switches have been erased and have no startup configurations. If you are unsure, contact your instructor.

Required Resources

- 1 Router
- 2 Switches
- 2 PCs (Windows 7, Vista, or XP with terminal emulation program, such as Tera Term)
- Console cables to configure the Cisco IOS devices via the console ports
- Ethernet cables as shown in the topology

Part 1:   Build the Network and Configure Basic Device Settings

In Part 1, you will set up the network topology and configure basic settings on the PC hosts, switches, and router.

Step 1:   Cable the network as shown in the topology.

Step 2:   Configure PC hosts.

Step 3:   Initialize and reload the router and switches as necessary.

Step 4: Configure basic settings for each switch.

a. Disable DNS lookup.

b. Configure device names as shown in the topology.

c. Assign **class** as the privileged EXEC password.

d. Assign **cisco** as the console and vty passwords.

e. Configure **logging synchronous** for the console line.

f. Configure the IP address listed in the Addressing Table for VLAN 1 on both switches.

g. Configure the default gateway on both switches.

h. Administratively deactivate all unused ports on the switch.

i. Copy the running configuration to the startup configuration

Step 5: Configure basic settings for the router.

a. Disable DNS lookup.

b. Configure device names as shown in the topology.

c. Configure the Lo0 IP address as shown in the Address Table. Do not configure subinterfaces at this time as they will be configured in Part 3.

d. Assign **cisco** as the console and vty passwords.

e. Assign **class** as the privileged EXEC password.

f. Configure **logging synchronous** to prevent console messages from interrupting command entry.

g. Copy the running configuration to the startup configuration.

Part 2: Configure Switches with VLANs and Trunking

In Part 2, you will configure the switches with VLANs and trunking.

Note: The required commands for Part 2 are provided in Appendix A. Test your knowledge by trying to configure S1 and S2 without referring to the appendix.

Step 1: Configure VLANs on S1.

a. On S1, configure the VLANs and names listed in the Switch Port Assignment Specifications table. Write the commands you used in the space provided.

```
S1(config)# vlan 10
S1(config-vlan)# name Students
S1(config-vlan)# vlan 20
S1(config-vlan)# name Faculty
S1(config-vlan)# exit
```

b. On S1, configure the interface connected to R1 as a trunk. Also configure the interface connected to S2 as a trunk. Write the commands you used in the space provided.

```
S1(config)# interface f0/5
S1(config-if)# switchport mode trunk
S1(config-if)# interface f0/1
S1(config-if)# switchport mode trunk
```

c. On S1, assign the access port for PC-A to VLAN 10. Write the commands you used in the space provided.

```
S1(config)# interface f0/6
S1(config-if)# switchport mode access
S1(config-if)# switchport access vlan 10
```

Step 2: Configure VLANs on Switch 2.

a. On S2, configure the VLANs and names listed in the Switch Port Assignment Specifications table.

b. On S2, verify that the VLAN names and numbers match those on S1. Write the command you used in the space provided.

c. On S2, assign the access port for PC-B to VLAN 20.

d. On S2, configure the interface connected to S1 as a trunk.

Part 3: Configure Trunk-Based Inter-VLAN Routing

In Part 3, you will configure R1 to route to multiple VLANs by creating subinterfaces for each VLAN. This method of inter-VLAN routing is called router-on-a-stick.

Note: The required commands for Part 3 are provided in Appendix A. Test your knowledge by trying to configure trunk-based or router-on-a-stick inter-VLAN routing without referring to the appendix.

Step 1: Configure a subinterface for VLAN 1.

a. Create a subinterface on R1 G0/1 for VLAN 1 using 1 as the subinterface ID. Write the command you used in the space provided.
     R1(config)# interface g0/1.1

b. Configure the subinterface to operate on VLAN 1. Write the command you used in the space provided.
     R1(config-subif)# encapsulation dot1Q 1

c. Configure the subinterface with the IP address from the Address Table. Write the command you used in the space provided.
     R1(config-subif)# ip address 192.168.1.1 255.255.255.0

Step 2: Configure a subinterface for VLAN 10.

a. Create a subinterface on R1 G0/1 for VLAN 10 using 10 as the subinterface ID.

b. Configure the subinterface to operate on VLAN 10.

c. Configure the subinterface with the address from the Address Table.

Step 3: Configure a subinterface for VLAN 20.

a. Create a subinterface on R1 G0/1 for VLAN 20 using 20 as the subinterface ID.

b. Configure the subinterface to operate on VLAN 20.

c. Configure the subinterface with the address from the Address Table.

Step 4: Enable the G0/0 interface.

Enable the G0/0 interface. Write the commands you used in the space provided.

R1(config)#interface g0/1
R1(config-if)#no shutdown

Step 5: Verify connectivity.

Enter the command to view the routing table on R1. What networks are listed?

R1#show ip route

From PC-A, is it possible to ping the default gateway for VLAN 10? Yes

From PC-A, is it possible to ping PC-B? Yes

From PC-A, is it possible to ping Lo0? Yes

From PC-A, is it possible to ping S2? Yes

If the answer is **no** to any of these questions, troubleshoot the configurations and correct any errors.

Reflection

What are the advantages of trunk-based or router-on-a-stick inter-VLAN routing?

The "router-on-a-stick" inter-VLAN routing method overcomes the limitation of the legacy inter-VLAN routing method.

 It requires only one physical Ethernet interface to route traffic between multiple VLANs on a network

Appendix A – Configuration Commands
Switch S1

R1(config-subif)# **exit**

Lab 6.3 – Home Activity

In the light of above experiments, Configure the following topology by using addressing table, VLAN and port assignment table. Also implement the port security features on all the switch ports.

Scenario

Suppose you are designing a small VLAN switched network with inter VLAN routing for three floors of SZABIST 100 campus.

Fig:6.3.1

Addressing Table:

Device	Interface	IP Address	Subnet Mask	Default Gateway
PC0	NIC	191.23.10.2	255.255.255.192	191.23.10.1
PC3	NIC	191.23.10.3	255.255.255.192	191.23.10.1
PC6	NIC	192.23.10.4	255.255.255.192	191.23.10.1
PC1	NIC	191.23.10.66	255.255.255.192	191.23.10.65
PC5	NIC	191.23.10.67	255.255.255.192	191.23.10.65
PC2	NIC	191.23.10.130	255.255.255.192	191.23.10.129
PC4	NIC	191.23.10.131	255.255.255.192	191.23.10.129
PC7	NIC	191.23.10.132	255.255.255.192	191.23.10.129
R1	G0/0.1	191.23.10.1	255.255.255.192	N/A
	G0/0.2	191.23.10.65	255.255.255.192	N/A
	G0/0.3	191.23.10.129	255.255.255.192	N/A

Table:6.3.1

VLANs and Ports Assigning Table:

VLANs	Name		Switchport Number		
			Access Ports		Trunk Ports

Lab 7.1 - Configuring IPv4 Static and Default Routes

Topology
Figure: 7.1.1

Addressing Table

Device	Interface	IP Address	Subnet Mask	Default Gateway
R1	G0/1	192.168.0.1	255.255.255.252	N/A
R1	G0/0	192.168.1.1	255.255.255.0	N/A
R2	G0/1	192.168.0.2	255.255.255.252	N/A
R2	G0/0	192.168.2.1	255.255.255.0	N/A
S1	VLAN 1	192.168.1.2	255.255.255.0	192.168.1.1
S2	VLAN 1	192.168.2.2	255.255.255.0	192.168.2.1
PC-A	NIC	192.168.1.3	255.255.255.0	192.168.1.1
PC-C	NIC	192.168.1.4	255.255.255.0	192.168.1.1
PC1	NIC	192.168.2.3	255.255.255.0	192.168.2.1
PC2	NIC	192.168.2.4	255.255.255.0	192.168.2.1

Table: 7.1.1

Objectives

Part 1: Set Up the Topology and Initialize Devices

Part 2: Configure Basic Device Settings and Verify Connectivity

Part 3: Configure Static Routes

- Configure a recursive static route.

- Configure a directly connected static route.

- Configure and remove static routes.

Part 4: Configure and Verify a Default Route

Background / Scenario

A router uses a routing table to determine where to send packets. The routing table contains a set of routes that describe which gateway or interface the router uses to reach a specified network. Initially, the routing table contains only directly connected networks. To communicate with distant networks, routes must be specified and added to the routing table.

In this lab, you will manually configure a static route to a specified distant network based on a next-hop IP address or exit interface. You will also configure a static default route. A default route is a type of static route that specifies a gateway to use when the routing table does not contain a path for the destination network.

Note: This lab provides minimal assistance with the actual commands necessary to configure static routing. However, the required commands are provided in Appendix A. Test your knowledge by trying to configure the devices without referring to the appendix.

Note: Make sure that the routers and switches have been erased and have no startup configurations. If you are unsure, contact your instructor.

Required Resources

- 3 Routers (1914,1914 and 2911)

- 3 Switches (2960)

- 2 PCs (Windows 7, Vista, or XP with terminal emulation program, such as Tera Term)

- Console cables to configure the Cisco IOS devices via the console ports

- Ethernet and serial cables as shown in the topology

Part 1:   Set Up the Topology and Initialize Devices

Step 1:   Cable the network as shown in the topology.

Step 2:   Initialize and reload the router and switch.

Part 2:   Configure Basic Device Settings and Verify Connectivity

In Part 2, you will configure basic settings, such as the interface IP addresses, device access, and passwords. You will verify LAN connectivity and identify routes listed in the routing tables for R1 and R3.

Step 1:   Configure the PC interfaces.

Step 2:   Configure basic settings on the routers.

a. Configure device names, as shown in the Topology and Addressing Table.

b. Disable DNS lookup.

c. Assign **class** as the enable password and assign **cisco** as the console and vty password.

d. Save the running configuration to the startup configuration file.

Step 3: Configure IP settings on the routers.

a. Configure the R1, R2 and R3 interfaces with IP addresses according to the Addressing Table.

b. The R1 G0/0 configuration is displayed below.

R1(config)# **interface G 0/0**

R1(config-if)# **ip address 192.168.1.1 255.255.255.0**

R1(config-if)# **no shutdown**

R1(config-if)# exit

c. The R2 G0/0 configuration is displayed below.

R2(config)# **interface G 0/0**

R2(config-if)# **ip address 192.168.2.1 255.255.255.0**

R2(config-if)# **no shutdown**

R2(config-if)# exit

Step 4: Verify connectivity of the LANs.

a. Test connectivity by pinging from each PC to the default gateway that has been configured for that host.

From PC-A, is it possible to ping the default gateway? _Yes_____

From PC1, is it possible to ping the default gateway? _Yes_____

b. Test connectivity by pinging between the directly connected routers.

From R1, is it possible to ping the G0/1 interface of R3? _Yes_____

If the answer is **no** to any of these questions, troubleshoot the configurations and correct the error.

c. Test connectivity between devices that are not directly connected.

From PC-A, is it possible to ping PC1? _Yes_____

Step 5: Gather information.

a. Check the status of the interfaces on R1 with the **show ip interface brief** command.

How many interfaces are activated on R1? _2_

b. Check the status of the interfaces on R2.

How many interfaces are activated on R2? _4_

c. View the routing table information for R1 using the **show ip route** command.

What networks are present in the Addressing Table of this lab, but not in the routing table for R1?

_loopback0,lookback1.192.168.1.0_____ _

d. View the routing table information for R2.

What networks are present in the Addressing Table in this lab, but not in the routing table for R2?

_192.168.0.0_____ _

Why are all the networks not in the routing tables for each of the routers?

_Only directly connected networks are shown because we don't have any routing so our routers do__ _

_no know about all the routes_____ _

Part 3: Configure Static Routes

In Part 3, you will employ multiple ways to implement static and default routes, you will confirm that the routes have been added to the routing tables of R1 and R3, and you will verify connectivity based on the introduced routes.

Note: This lab provides minimal assistance with the actual commands necessary to configure static routing. However, the required commands are provided in Appendix A. Test your knowledge by trying to configure the devices without referring to the appendix.

Step 1:   Configure a recursive static route.

With a recursive static route, the next-hop IP address is specified. Because only the next-hop IP is specified, the router must perform multiple lookups in the routing table before forwarding packets. To configure recursive static routes, use the following syntax:

Router(config)# **ip route** *network-address subnet-mask ip-address*

Step 2:   Configure a directly connected static route.

With a directly connected static route, the *exit-interface* parameter is specified, which allows the router to resolve a forwarding decision in one lookup. A directly connected static route is typically used with a point-to-point serial interface. To configure directly connected static routes with an exit interface specified, use the following syntax:

Router(config)# **ip route** *network-address subnet-mask exit-intf*

Step 3:   Configure a static route.

a.   On the R1 router, configure a static route to the 198.168.2.0 network using one of the static route configuration options from the previous steps. Write the command you used in the space provided.

R1(config)#ip route 198.133.219.0 255.255.255.0 S0/0/1

b.   On the R2 router, configure a static route to the 192.168.1.0 network using the other static route configuration option from the previous steps. Write the command you used in the space provided.

R1(config)# ip route 209.165.200.224 255.255.255.224 S0/0/1

c.   View the routing table to verify the new static route entry.

How is this new route listed in the routing table?

 S 198.133.219.0/24 is directly connected, Serial 0/0/1

d.   From host PC-A, is it possible to ping the R2 address 192.168.2.3? Yes

This ping should be successful.

Part 4:   Configure and Verify a Default Route

In Part 4, you will implement a default route, confirm that the route has been added to the routing table, and verify connectivity based on the introduced route.

A default route identifies the gateway to which the router sends all IP packets for which it does not have a learned or static route. A default static route is a static route with 0.0.0.0 as the destination IP address and subnet mask. This is commonly referred to as a "quad zero" route.

In a default route, either the next-hop IP address or exit interface can be specified. To configure a default static route, use the following syntax:

Router(config)# **ip route 0.0.0.0 0.0.0.0** {*ip-address or exit-intf*}

a.   Configure the R1 router with a default route using the exit interface of S0/0/1. Write the command you used in the space provided.

Reflection

1. A new network 192.168.3.0/24 is connected to interface G0/2 on R1. What commands could be used to configure a static route to that network from R2?

   192.168.3.0 255.255.0 10.1.1.1

   ip route 192.168.3.0 255.255.255.0 s0/0/0,

   ip route 0.0.0.0.0.0.0.0 s0/0/

2. Is there a benefit to configuring a directly connected static route instead of a recursive static route?

   This is only required for the output interface and not the address of the next hop

3. Why is it important to configure a default route on a router?

   Because there will be many cases where we don't know the next hop address

Appendix A: Configuration Commands for Parts 2, 3, and 4

The commands listed in Appendix A are for reference only. This Appendix does not include all the specific commands necessary to complete this lab.

Basic Device Settings

Configure IP settings on the router.

a. The R1 G0/0 configuration is displayed below.

R1(config)# **interface G 0/0**

R1(config-if)# **ip address 192.168.1.1 255.255.255.0**

R1(config-if)# **no shutdown**

R1(config-if)# exit

b. The R1 G0/1 configuration is displayed below.
R1(config)# **interface G 0/1**

R1(config-if)# **ip address 192.168.0.1 255.255.255.252**

R1(config-if)# **no shutdown**

R1(config-if)# exit

c. The R2 G0/0 configuration is displayed below.
R2(config)# **interface G 0/0**

R2(config-if)# **ip address 192.168.2.1 255.255.255.0**

R2(config-if)# **no shutdown**

R2(config-if)# exit

d. The R2 G0/1 configuration is displayed below.

R2(config)# **interface G 0/1**

R2(config-if)# **ip address 192.168.0.2 255.255.255.252**

R2(config-if)# **no shutdown**

R2(config-if)# exit

Static Route Configurations

a. On Router 1

R1 (config) # **ip route 192.168.2.0 255.255.255.0 192.168.0.2**

b. On Router 2

R2 (config) # **ip route 192.168.1.0 255.255.255.0 192.168.0.1**

Lab 7.2 - Configuring IPv4 Static Routes

Table: 7.2.1

Objectives

Part 1: Set Up the Topology and Initialize Devices

Part 2: Configure Basic Device Settings and Verify Connectivity

Part 3: Configure Static Routes

Required Resources

- 3 Routers (1914,1914 and 2911)
- 3 Switches (2960)
- 2 PCs (Windows 7, Vista, or XP with terminal emulation program, such as Tera Term)
- Console cables to configure the Cisco IOS devices via the console ports
- Ethernet and serial cables as shown in the topology

Part 1:   Set Up the Topology and Initialize Devices

Step 1:   Cable the network as shown in the topology.

Step 2:   Initialize and reload the router and switch.

Part 2:   Configure Basic Device Settings and Verify Connectivity

In Part 2, you will configure basic settings, such as the interface IP addresses, device access, and passwords. You will verify LAN connectivity and identify routes listed in the routing tables for R1 and R3.

Step 1:   Configure the PC interfaces.

Step 2:   Configure basic settings on the routers.

a.   Configure device names, as shown in the Topology and Addressing Table.

b.   Disable DNS lookup.

c.   Assign **class** as the enable password and assign **cisco** as the console and vty password.

d.   Save the running configuration to the startup configuration file.

Step 3:   Configure IP settings on the routers.

a.   Configure the R1, R2 and R3 interfaces with IP addresses according to the Addressing Table.

Step 4:   Verify connectivity of the LANs.

a.   Test connectivity by pinging from each PC to the default gateway that has been configured for that host.

b.   Test connectivity by pinging between the directly connected routers.

c.   Test connectivity between devices that are not directly connected.

Step 5:   Gather information.

a.   Check the status of the interfaces on R1 with the **show ip interface brief** command.

b.   View the routing table information for R1 using the **show ip route** command.

c.   View the routing table information for R2 and R3.

Part 3:   Configure Static Routes

Appendix A: Configuration Commands

The commands listed in Appendix A are for reference only. This Appendix does not include all the specific commands necessary to complete this lab.

Basic Device Settings

Configure IP settings on the routers.

a. The R1 G0/0 configuration is displayed below.

R1(config)# **interface G 0/0**

R1(config-if)# **ip address 192.168.2.1 255.255.255.252**
R1(config-if)# **no shutdown**
R1(config-if)# exit

b. The R1 G0/1 configuration is displayed below.

R1(config)# **interface G 0/1**

R1(config-if)# **ip address 192.168.1.1 255.255.255.0**
R1(config-if)# **no shutdown**
R1(config-if)# exit

c. The R2 G0/0 configuration is displayed below.

R2(config)# **interface G 0/0**
R2(config-if)# **ip address 192.168.2.2 255.255.255.252**
R2(config-if)# **no shutdown**
R2(config-if)# exit

d. The R2 G0/1 configuration is displayed below.

R2(config)# **interface G 0/1**
R2(config-if)# **ip address 192.168.0.1 255.255.255.0**
R2(config-if)# **no shutdown**
R2(config-if)# exit

e. The R2 G0/2 configuration is displayed below.
R2(config)# **interface G 0/2**
R2(config-if)# **ip address 192.168.3.1 255.255.255.252**
R2(config-if)# **no shutdown**
R2(config-if)# exit

f. The R3 G0/0 configuration is displayed below.
R3(config)# **interface G 0/0**
R3(config-if)# **ip address 192.168.3.2 255.255.255.252**
R3(config-if)# **no shutdown**
R3(config-if)# exit

g. The R3 G0/1 configuration is displayed below.
R3(config)# **interface G 0/1**
R3(config-if)# **ip address 192.168.4.1 255.255.255.0**
R3(config-if)# **no shutdown**
R3(config-if)# exit

Static Route Configurations

    a.   On Router 1

        R1 (config) # **ip route 192.168.0.0 255.255.255.0 192.168.2.2**

        R1 (config) # **ip route 192.168.3.0 255.255.255.252 192.168.2.2**

        R1 (config) # **ip route 192.168.4.0 255.255.255.0 192.168.2.2**

    b.   On Router 2

        R2 (config) # **ip route 192.168.1.0 255.255.255.0 192.168.2.1**

        R2 (config) # **ip route 192.168.4.0 255.255.255.0 192.168.3.2**

    c.   On Router 3

        R3 (config) # **ip route 192.168.0.0 255.255.255.0 192.168.3.1**

        R3 (config) # **ip route 192.168.2.0 255.255.255.252 192.168.3.1**

        R3 (config) # **ip route 192.168.1.0 255.255.255.0 192.168.3.1**

Lab 8.1.1– Configuring Basic RIP

Topology:
Figure: 8.1.1

Addressing Table

Device	Interface	IP Address	Subnet Mask	Default Gateway
R1	G0/1	192.168.0.1	255.255.255.252	N/A
R1	G0/0	192.168.1.1	255.255.255.0	N/A
R2	G0/1	192.168.0.2	255.255.255.252	N/A
R2	G0/0	192.168.2.1	255.255.255.0	N/A
PC-A	NIC	192.168.1.3	255.255.255.0	192.168.1.1
PC-C	NIC	192.168.1.4	255.255.255.0	192.168.1.1
PC1	NIC	192.168.2.3	255.255.255.0	192.168.2.1
PC2	NIC	192.168.2.4	255.255.255.0	192.168.2.1

Table: 8.1.1

Objectives

Part 1: Build the Network and Configure Basic Device Settings

Part 2: Configure and Verify RIP Routing

- Configure and verify RIP is running on routers.
- Configure a passive interface.
- Examine routing tables.
- Disable automatic summarization.
- Configure a default route.
- Verify end-to-end connectivity.

Part 4: Configure and Verify RIPng Routing

- Configure and verify RIPng is running on routers.
- Examine routing tables.
- Configure a default route.
- Verify end-to-end connectivity.

Background / Scenario

RIP version 2 (RIPv2) is used for routing of IPv4 addresses in small networks. RIPv2 is a classless, distance-vector routing protocol, as defined by RFC 1723. Because RIPv2 is a classless routing protocol, subnet masks are included in the routing updates. By default, RIPv2 automatically summarizes networks at major network boundaries. When automatic summarization has been disabled, RIPv2 no longer summarizes networks to their classful address at boundary routers.

RIPng (RIP Next Generation) is a distance-vector routing protocol for routing IPv6 addresses, as defined by RFC 2080. RIPng is based on RIPv2 and has the same administrative distance and 15-hop limitation.

In this lab, you will configure the network topology with RIPv2 routing, disable automatic summarization, propagate a default route, and use CLI commands to display and verify RIP routing information.

Note: The routers used with CCNA hands-on labs are Cisco 1941 Integrated Services. The switches used are Cisco Catalyst 2960s). Other routers, switches, and Cisco IOS versions can be used. Depending on the model and Cisco IOS version, the commands available and output produced might vary from what is shown in the labs.

Note: Make sure that the routers and switches have been erased and have no startup configurations. If you are unsure, contact your instructor.

Required Resources

- 2 Routers (Cisco 1941 or 2900)
- 2 Switches (Cisco 2960)
- 3 PCs (Windows 7, Vista, or XP with terminal emulation program, such as Tera Term)
- Console cables to configure the Cisco IOS devices via the console ports
- Ethernet and Serial cables as shown in the topology

Part 1: Build the Network and Configure Basic Device Settings

In Part 1, you will set up the network topology and configure basic settings.

Step 1: Cable the network as shown in the topology.

Step 2: Initialize and reload the router and switch.

Step 3: Configure basic settings for each router and switch.

    a. Disable DNS lookup.

    b. Configure device names as shown in the topology.

    c. Configure password encryption.

    d. Assign **class** as the privileged EXEC password.

    e. Assign **cisco** as the console and vty passwords.

    f. Configure a MOTD banner to warn users that unauthorized access is prohibited.

    g. Configure the IP address listed in the Addressing Table for all interfaces.

    h. Configure a description to each interface with an IP address..

    i. Copy the running-configuration to the startup-configuration.

Step 4: Configure PC hosts.

Refer to the Addressing Table for PC host address information.

Step 5: Test connectivity.

At this point, the PCs are unable to ping each other.

    a. Each workstation should be able to ping the attached router. Verify and troubleshoot if necessary.

    b. The routers should be able to ping one another. Verify and troubleshoot if necessary.

Part 2: Configure and Verify RIP Routing

In Part 2, you will configure RIP routing on all routers in the network and then verify that routing tables are updated correctly. After RIP has been verified, you will disable automatic summarization, configure a default route, and verify end-to-end connectivity.

Step 1: Configure RIP routing.

    a. On R1, configure RIP as the routing protocol and advertise the appropriate networks. R1# **config t**

    R1(config)# **router rip**

    R1(config-router)# **network 192.168.1.0**

    R1(config-router)# **network 192.168.0.0**

    R1(config-router)# **passive-interface g0/1**

    The **passive-interface** command stops routing updates out the specified interface. This process prevents unnecessary routing traffic on the LAN. However, the network that the specified interface belongs to is still advertised in routing updates that are sent out across other interfaces.

    b. Configure RIP on R2 and use the **network** statement to add appropriate networks and prevent routing updates on the LAN interface.

Step 2: Examine current state of network.

a. The status of the two links can quickly be verified using the **show ip interface brief** command on R1. R1# **show ip interface brief**

Interface	IP-Address	OK? Method Status	Protocol
GigabitEthernet0/0	192.168.0.1	YES manual up	up
GigabitEthernet0/1	192.168.1.1	YES manual up	up

b. Check connectivity between PCs.

From PC-A, is it possible to ping PC-B?__Yes_____Why? ____Same network with a default gateway____

From PC-A, is it possible to ping PC-1? __No_____Why? ___Different networks with no route_____

From PC-1, is it possible to ping PC-B? __No_____Why? ___Different networks with no route_____

From PC-1, is it possible to ping PC-A? __No____Why? ___Different networks with no route_____

c. Verify that RIP is running on the routers.

You can use the **debug ip rip**, **show ip protocols**, and **show run** commands to confirm that RIPv2 is running. The **show ip protocols** command output for R1 is shown below.

R1#   **show   ip**

protocols Router#show

ip   protocols   Routing

Protocol is "rip"

Sending updates every 30 seconds, next due in 23 seconds

Invalid after 180 seconds, hold down 180, flushed after 240

Outgoing update filter list for all interfaces is not set

Incoming update filter list for all interfaces is not set

Redistributing: rip

Default version control: send version 1, receive any

  version InterfaceSend Recv Triggered RIP Key-chain

  GigabitEthernet0/1   1   2 1

  GigabitEthernet0/0   1   2 1

Automatic network summarization is in

effect Maximum path: 4

Routing for Networks:

          192.168.0.0

          192.168.1.0

Passive Interface(s):

Routing Information Sources:

Gateway	Distance	Last Update
192.168.0.2	120	00:00:13

Distance: (default is 120)

When issuing the **debug ip rip** command on R2, what information is provided that confirms RIP is running?

 A status information of the debugging, entries table about different networks

When you are finished observing the debugging outputs, issue the **undebug all** command at the privileged EXEC prompt.

d.   Examine the automatic summarization of routes.

The LANs connected to R1 and R2 are composed of discontiguous networks..

R1# **show ip route**

R 192.168.0.0/24 [120/1] via 192.168.2.2, 00:00:23, GigabitEthernet0/0

   192.168.1.0/24 is variably subnetted, 2 subnets, 2 masks

C   192.168.1.0/24 is directly connected, GigabitEthernet0/1

L   192.168.0.1/24 is directly connected, GigabitEthernet0/1

   192.168.0.0/24 is variably subnetted, 2 subnets, 2 masks

C   192.168.2.0/30 is directly connected, GigabitEthernet0/0

L   192.168.2.1/32 is directly connected, GigabitEthernet0/0

R 192.168.3.0/24 [120/1] via 192.168.2.2, 00:00:23, GigabitEthernet0/0R3 only displays its own subnets for the 172.30.0.0 network. R3 does not have any routes for the 172.30.0.0 subnets on R1.

R2# **show ip route**
<Output omitted>

R2# **show ip route**

Gateway of last resort is not set

   192.168.0.0/24 is variably subnetted, 2 subnets, 2 masks

C   192.168.0.0/30 is directly connected, GigabitEthernet0/0

L   192.168.0.2/32 is directly connected, GigabitEthernet0/0

 R 192.168.1.0/24 [120/1] via 192.168.0.1, 00:00:01, GigabitEthernet0/0

   192.168.2.0/24 is variably subnetted, 2 subnets, 2 masks

C   192.168.2.0/24 is directly connected, GigabitEthernet0/1

L   192.168.2.1/32 is directly connected, GigabitEthernet0/1

R3# **show ip route**

e.   Use the **debug ip rip** command on R2 to exam the RIP updates.

R2# debug ip rip

After 60 seconds, issue the **no debug ip rip** command.

PC6	NIC	192.168.3.3	255.255.255.0	192.168.3.1

Table:9.1.1

Objectives

Part 1: Build the Network and Configure Basic Device Settings

Part 2: Configure and Verify OSPF Routing

Background / Scenario

Open Shortest Path First (OSPF) is a link-state routing protocol for IP networks. OSPFv2 is defined for IPv4 networks. OSPF detects changes in the topology, such as link failures, and converges on a new loop-free routing structure very quickly. It computes each route using Dijkstra's algorithm, a shortest path first algorithm.

In this lab, you will configure the network topology with OSPFv2 routing and use a number of CLI commands to display and verify OSPF routing information.

Note: Make sure that the routers have been erased and have no startup configurations. If you are unsure, contact your instructor.

Required Resources

- 3 Routers (Cisco 2911)
- 6 PCs (Windows 7, Vista, or XP with terminal emulation program, such as Tera Term)
- Console cables to configure the Cisco IOS devices via the console ports
- Ethernet and serial cables as shown in the topology

Part 1: Build the Network and Configure Basic Device Settings

In Part 1, you set up the network topology and configure basic settings on the PC hosts and routers.

Step 1:   Cable the network as shown in the topology.

Step 2:   Initialize and reload the routers as necessary.

Step 3:   Configure basic settings for each router.

a. Disable DNS lookup.

b. Configure device name as shown in the topology.

c. Assign **class** as the privileged EXEC password.

d. Assign **cisco** as the console and vty passwords.

e. Configure a message of the day (MOTD) banner to warn users that unauthorized access is prohibited.

f. Configure the IP address listed in the Addressing Table for all interfaces.

g. Copy the running configuration to the startup configuration.

Step 4:   Configure PC hosts.

Step 5:   Test connectivity.

The routers should be able to ping one another, and each PC should be able to ping its default gateway. The PCs are unable to ping other PCs until OSPF routing is configured. Verify and troubleshoot if necessary.

Part 2: Configure and Verify OSPF Routing

In Part 2, you will configure OSPF routing on all routers in the network and then verify that routing tables are updated correctly. After OSPF has been verified, you will configure OSPF authentication on the links for added security.

Step 1:   Configure OSPF on R1,R2 and R3.

a.   Use the **router ospf** command in global configuration mode to enable OSPF on

R1. R1(config)# **router ospf 1**

Note: The OSPF process id is kept locally and has no meaning to other routers on the network.

b.   Configure the **network** statements for the networks on R1. Use an area ID of
0. R1(config)# **router ospf 1**

R1(config-router)# **network 192.168.1.0 0.0.0.255 area 0**

R1(config-router)# **network 192.168.0.0 0.0.0.3 area 0**

c.   Configure the **network** statements for the networks on R2. Use an area ID of 0.
R2(config)# **router ospf 1**

R2(config-router)# **network 192.168.2.0 0.0.0.63 area 0**

R2(config-router)# **network 192.168.0.0 0.0.0.3 area 0**

R2(config-router)# **network 192.168.0.4 0.0.0.3 area 0**

d.   Configure the **network** statements for the networks on R3. Use an area ID of 0.
R3(config)# **router ospf 1**

R3(config-router)# **network 192.168.3.0 0.0.0.31 area 0**

R3(config-router)# **network 192.168.0.4 0.0.0.3 area 0**

Step 2:   Verify OSPF neighbors and routing information.

a.   Issue the **show ip ospf neighbor** command to verify that each router lists the other routers in the network as neighbors.

R1# **show ip ospf neighbor**

b.   Issue the **show ip route** command to verify that all networks display in the routing table on all routers.

R1# **show ip route**

Step 3:   Verify OSPF protocol settings.

The **show ip protocols** command is a quick way to verify vital OSPF configuration information. This information includes the OSPF process ID, the router ID, networks the router is advertising, the neighbors the router is receiving updates from, and the default administrative distance, which is 110 for OSPF.

R1# **show ip protocols**

Step 4:   Verify OSPF process information.

Use the **show ip ospf** command to examine the OSPF process ID and router ID. This command displays the OSPF area information, as well as the last time the SPF algorithm was calculated.

R1# **show ip ospf**

Step 5:   Verify OSPF interface settings.

a.   Issue the **show ip ospf interface brief** command to display a summary of OSPF-enabled interfaces.

R1# **show ip ospf interface brief**

b.   For a more detailed list of every OSPF-enabled interface, issue the **show ip ospf interface**

command. R1# **show ip ospf interface**

Step 6:   Verify end-to-end connectivity.

Each PC should be able to ping the other PCs in the topology. Verify and troubleshoot if necessary.

Table:10.1.1

Objectives

Part 1: Build the Network and Configure Basic Device Settings

Part 2: Configure and Verify EIGRP Routing

Background / Scenario

Enhanced Interior Gateway Routing Protocol (EIGRP) is is an advanced distance-vector routing protocol for IP networks. In this lab, you will configure the network topology with EIGRP routing, and use a number of CLI commands to display and verify EIGRP routing information.

Note: Make sure that the routers have been erased and have no startup configurations. If you are unsure, contact your instructor.

Required Resources

- 3 Routers (Cisco 2911)
- 6 PCs (Windows 7, Vista, or XP with terminal emulation program, such as Tera Term)
- Console cables to configure the Cisco IOS devices via the console ports
- Ethernet and serial cables as shown in the topology

Part 1: Build the Network and Configure Basic Device Settings

In Part 1, you set up the network topology and configure basic settings on the PC hosts and routers.

Step 1: Cable the network as shown in the topology.

Step 2: Initialize and reload the routers as necessary.

Step 3: Configure basic settings for each router.

a. Disable DNS lookup.

b. Configure device name as shown in the topology.

c. Assign **class** as the privileged EXEC password.

d. Assign **cisco** as the console and vty passwords.

e. Configure a message of the day (MOTD) banner to warn users that unauthorized access is prohibited.

f. Configure the IP address listed in the Addressing Table for all interfaces.

g. Copy the running configuration to the startup configuration.

Step 4: Configure PC hosts.

Step 5: Test connectivity.

The routers should be able to ping one another, and each PC should be able to ping its default gateway. The PCs are unable to ping other PCs until EIGRP routing is configured. Verify and troubleshoot if necessary.

Part 2:   Configure and Verify EIGRP Routing

In Part 2, you will configure EIGRPv2 routing on all routers in the network and then verify that routing tables are updated correctly. After EIGRP has been verified, you will configure EIGRP authentication on the links for added security.

Step 1:   Configure EIGRP on R1,R2 and R3.

a.   Use the **router EIGRP** command in global configuration mode to enable EIGRP on R1.

R1(config)# **router EIGRP 1**

Note: The EIGRP Autonomous System Number is kept locally and has no meaning to other routers on the network.

b.   Configure the **network** statements for the networks on
R1. R1(config)# **router EIGRP 1**
R1(config-router)# **network 192.168.1.0 0.0.0.255**
R1(config-router)# **network 192.168.0.0 0.0.0.3**

c.   Configure the **network** statements for the networks on

R2. R2(config)# **router EIGRP 1**
R2(config-router)# **network 192.168.2.0 0.0.0.63**
R2(config-router)# **network 192.168.0.0 0.0.0.3**
R2(config-router)# **network 192.168.0.4 0.0.0.3**

d.   Configure the **network** statements for the networks on

R3. R3(config)# **router EIGRP 1**
R3(config-router)# **network 192.168.3.0 0.0.0.31**
R3(config-router)# **network 192.168.0.4 0.0.0.3**

Step 2: Verify EIGRP neighbors and routing information.

a. Issue the **show ip EIGRP neighbor** command to verify that each router lists the other routers in the network as neighbors.

R1# **show ip EIGRP neighbor**

b. Issue the **show ip route** command to verify that all networks display in the routing table on all routers.

R1# **show ip route**

Step 3: Verify EIGRP protocol settings.

The **show ip protocols** command is a quick way to verify vital EIGRP configuration information. This information includes the EIGRP process ID, the router ID, networks the router is advertising, the neighbors the router is receiving updates from, and the default administrative distance, which is 110 for EIGRP.

R1# **show ip protocols**

Step 4: Verify EIGRP process information.

Use the **show ip EIGRP** command to examine the EIGRP process ID and router ID. This command displays the EIGRP area information, as well as the last time the SPF algorithm was calculated.

R1# **show ip EIGRP**

Step 5: Verify EIGRP interface settings.

a. Issue the **show ip EIGRP interface brief** command to display a summary of EIGRP-enabled interfaces.

R1# **show ip EIGRP interface brief**

b. For a more detailed list of every EIGRP-enabled interface, issue the **show ip EIGRP interface**

command. R1# **show ip EIGRP interface**

Step 6: Verify end-to-end connectivity.

Each PC should be able to ping the other PCs in the topology. Verify and troubleshoot if necessary.

# Lab 10.2– Home Activity for Configuring Basic EIGRP
